

Energy Levels of Light Nuclei $A = 9$

F. Ajzenberg-Selove

University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396

Abstract: An evaluation of $A = 5-10$ was published in *Nuclear Physics A490* (1988), p. 1. This version of $A = 9$ differs from the published version in that we have corrected some errors discovered after the article went to press. The introduction and introductory tables have been omitted from this manuscript. [Reference](#) key numbers have been changed to the NNDC/TUNL format.

Not observed: see (1979AJ01) and (1983BE55; theor.).

⁹He
(Fig. 4)

⁹He has been observed in the ⁹Be(¹⁴C, ¹⁴O) reaction at $E(^{14}\text{C}) = 158$ MeV (1987BEYI) and in the ⁹Be(π^- , π^+) reaction at $E_{\pi^-} = 180$ and 194 MeV (1987SE05): the atomic mass excesses are 41.5 ± 1.0 MeV and 40.80 ± 0.10 MeV, respectively. We adopt the latter value. ⁹He is then unstable with respect to decay into ⁸He + n by 1.13 MeV. (1987SE05) also report the population of excited states of ⁹He at 1.2, 3.8 and 7.0 MeV, while (1987BEYI) suggest an excited state at ≈ 1.8 MeV with $\Gamma \approx 3$ MeV. Excited states are calculated at 1.64, 3.86 and 6.53 MeV, with $J^\pi = \frac{1}{2}^+$, $\frac{5}{2}^+$ and $\frac{3}{2}^-$ [(0+1) $\hbar\omega$ model space]. In the (0+2) $\hbar\omega$ model space the normal-parity excited states are at 6.44, 29.09 and 29.42 MeV with $J^\pi = \frac{3}{2}^-$, $\frac{7}{2}^-$, $\frac{3}{2}^-$. In both cases the ground state is $J^\pi = \frac{1}{2}^-$, as would be expected (1985PO10). $$\mu = 3.4391 \pm 0.0006 \text{ nm (1983CO11)}. \text{ See also (1987AR22).}$$

$$Q = (0.88 \pm 0.18) Q \text{ of } {}^7\text{Li (1983CO11)}.$$

[A preliminary report by (1988ARZU) gives $Q = (0.69 \pm 0.03) \times Q({}^7\text{Li})$.]

The interaction nuclear radius of ${}^9\text{Li}$ is $2.41 \pm 0.02 \text{ fm (1985TA18)}$. [See also for derived nuclear matter, charge and neutron matter r.m.s. radii.]

$$1. {}^9\text{Li}(\beta^-){}^9\text{Be} \quad Q_m = 13.606$$

The half-life of ${}^9\text{Li}$ is $178.3 \pm 0.4 \text{ msec}$: see (1979AJ01). See also (1986CU01, 1988SA04). ${}^9\text{Li}$ decays to a number of states in ${}^9\text{Be}$: see reaction 12 in ${}^9\text{Be}$ and Table 9.7. The nature of the decay to ${}^9\text{Be}^*(0, 2.43)$ with $J^\pi = \frac{3}{2}^-, \frac{5}{2}^-$ is evidence for $J^\pi = \frac{3}{2}^-$ for ${}^9\text{Li}_{\text{g.s.}}$. The probability for delayed neutron decay, P_n , is $(49.5 \pm 5)\%$: see (1984AJ01). See also (1986RO27), (1985HA1K) and (1983KU17; theor.).

$$2. {}^7\text{Li}(t, p){}^9\text{Li} \quad Q_m = -2.386$$

Protons are observed to excited states at $E_x = 2.691 \pm 0.005, 4.31 \pm 0.02, 5.38 \pm 0.06$ and $6.430 \pm 0.015 \text{ MeV}$. The widths of the three highest states, which are unbound, are $100 \pm 30, 600 \pm 100$ and $40 \pm 20 \text{ keV}$, respectively. Angular distributions have been studied at $E_t = 11.3, 15$ and 23 MeV . At the highest energy they are consistent with $J^\pi = \frac{3}{2}^-, (\frac{1}{2}^-)$ and $\geq \frac{9}{2}$ for ${}^9\text{Li}^*(0, 2.69, 6.43)$: see (1979AJ01). See also (1984AJ01) and ${}^{10}\text{Be}$.

Fig. 1: Energy levels of ${}^9\text{Li}$. In these diagrams, energy values are plotted vertically in MeV, based on the ground state as zero. Uncertain levels or transitions are indicated by dashed lines; levels which are known to be particularly broad are cross-hatched. Values of total angular momentum J , parity, and isobaric spin T which appear to be reasonably well established are indicated on the levels; less certain assignments are enclosed in parentheses. For reactions in which ${}^9\text{Li}$ is the compound nucleus, some typical thin-target excitation functions are shown schematically, with the yield plotted horizontally and the bombarding energy vertically. Bombarding energies are indicated in laboratory coordinates and plotted to scale in cm coordinates. Excited states of the residual nuclei involved in these reactions have generally not been shown; where transitions to such excited states are known to occur, a brace is sometimes used to suggest reference to another diagram. For reactions in which the present nucleus occurs as a residual product, excitation functions have not been shown; a vertical arrow with a number indicating some bombarding energy, usually the highest, at which the reaction has been studied, is used instead. Further information on the levels illustrated, including a listing of the reactions in which each has been observed, is contained in the master table, entitled “Energy levels of ${}^9\text{Li}$ ”.

3. ${}^9\text{Be}(\gamma, \pi^+){}^9\text{Li}$ $Q_m = -153.175$

The angular distribution of the π^+ to ${}^9\text{Li}_{\text{g.s.}}$ has been measured at $E_e = 200$ MeV (1983SH19). For the earlier work see (1984AJ01).

4. ${}^9\text{Be}(\pi^-, \gamma){}^9\text{Li}$ $Q_m = 125.962$

Capture branching ratios to ${}^9\text{Li}^*(0, 2.69)$ are reported by (1986PE05).

5. ${}^9\text{Be}({}^7\text{Li}, {}^7\text{Be}){}^9\text{Li}$ $Q_m = -14.468$

See (1984GL06: $E({}^7\text{Li}) = 78$ MeV).

6. ${}^{11}\text{B}({}^6\text{Li}, {}^8\text{B}){}^9\text{Li}$ $Q_m = -25.121$

At $E({}^6\text{Li}) = 80$ MeV the angular distribution to ${}^9\text{Li}_{\text{g.s.}}$ has been measured. States at $E_x = 2.59 \pm 0.10, 4.36 \pm 0.10$ and 6.38 ± 0.12 MeV are also populated: see (1979AJ01).

The 0° differential cross section for reaction (a) increases monotonically between $E_t = 0.10$ and 2.4 MeV. A resonance has been reported at $E_t = 1.875$ MeV (${}^9\text{Be}^*(18.94)$). The excitation function for ${}^8\text{Li}$ (reaction (b)) increases monotonically for $E_t = 0.275$ to 1.000 MeV. See (1974AJ01) for references. In the range $E_t = 2$ to 10 MeV the total cross section for reaction (b)

shows a broad structure [$\Gamma_{\text{c.m.}} = 1.5 \text{ MeV}$] at $E_t = 4.2 \text{ MeV}$ (${}^9\text{Be}^* = 20.5 \text{ MeV}$) (1986AB04; prelim.). Yields and angular distributions for reaction (c) have been measured at $E_t = 2$ to 4.5 MeV (1984LIZY; prelim.). See also (1984AJ01) for other channels and (1984KR1B; theor.).

2. ${}^6\text{Li}({}^3\text{He}, \pi^+){}^9\text{Be}$

$$Q_m = -121.899$$

The energy dependence of the π^+ to ${}^9\text{Be}_{\text{g.s.}}$ has been measured at $E({}^3\text{He}) = 235$ to 283 MeV (1984WI06).

^a See Tables 9.6 in (1979AJ01, 1984AJ01) for references.

^b Assumed identical to ${}^9\text{Be}$.

Angular distributions of p_0 have been measured at $E_\alpha = 10.2$ to 14.7 MeV and at 30 MeV: see (1974AJ01). See also (1987BI1C) and (1983BE51; theor.).

4. ${}^7\text{Li}(d, \gamma){}^9\text{Be}$

$$Q_m = 16.6951$$

For $E_d = 0.1$ to 1.1 MeV, a resonance in the yield of capture γ -rays is observed at $E_d = 360.8 \pm 0.3$ keV (1987ZI01), 360.7 ± 1.8 keV (1986BE33), corresponding to the excitation of ${}^9\text{Be}^*(16.97)$, the second $T = \frac{3}{2}$ state [$J^\pi = \frac{1}{2}^-$]: see Table 9.4 (1987ZI01). The reduced width for the isospin “forbidden” deuteron breakup is 5.4×10^{-4} relative to the Wigner limit (1987ZI01). See also (1984AJ01).

5. (a) ${}^7\text{Li}(d, n){}^8\text{Be}$ $Q_m = 15.0297$ $E_b = 16.6951$
 (b) ${}^7\text{Li}(d, \alpha){}^5\text{He}$ $Q_m = 14.23$
 (c) ${}^7\text{Li}(d, n)2\text{ }{}^4\text{He}$ $Q_m = 15.1216$

The yield of neutrons has been measured for $E_d = 0.2$ to 23 MeV [see (1979AJ01)] and at $E_d = 0.19$ to 0.55 MeV (1987DA25). See also (1983SZZY). Polarization measurements have been carried out at $E_d = 0.64$ MeV and 2.5 to 3.7 MeV [see (1974AJ01)] and at 0.40 and 0.46 MeV (1984GA07; n_0). Resonances are reported at 0.36 , 0.68 and 0.98 MeV: see Table 9.3 in (1974AJ01). See also (1985CA41; astrophys.).

The yields of α -particles have been measured for $E_d = 0.25$ to 3.0 MeV: see (1974AJ01, 1979AJ01). Resonances are reported at $E_d = 0.75$, 1.00 and 2.5 MeV; the latter is broad: see Table 9.3 in (1979AJ01). See also (1983SZZY), (1986DIZT, 1987LE1F; applied) and (1984KR1B; theor.).

6. ${}^7\text{Li}(d, p){}^8\text{Li}$ $Q_m = -0.192$ $E_b = 16.6951$

Excitation functions and cross sections have been measured for $E_d = 0.29$ to 7 MeV [see (1974AJ01, 1979AJ01, 1984AJ01)] and 0.60 to 0.95 MeV (1983FI13). See also (1983SZZY, 1986AB04). Resonances are reported at $E_d = 0.360(3)$ [< 0.5], $0.776(7)$ [250], $1.027(7)$ [60], 2.0 [broad], $2.375(50)$, $3.220(50)$ [400 ± 100] and ≈ 4.8 MeV [Γ_{lab} in keV] corresponding to ${}^9\text{Be}^*(16.975)$ [see also Table 9.4], 17.298 , 17.493 , (18.5) , 18.54 , 19.20 , 20.4): for references see Tables 9.3 in (1979AJ01, 1984AJ01). The total cross section at the $E_d = 0.78$ MeV resonance is important because it serves as normalization for the ${}^7\text{Be}(p, \gamma){}^8\text{B}$ reaction: the “best” value suggested by (1983FI13) is 157 ± 10 mb. See also (1986BA38) and (1974AJ01, 1984AJ01) for the earlier values. At $E({}^7\text{Li}) = 12.2 \pm 1.3$ MeV [corresponding to $E_d = 3.5$ MeV] the cross section is reported to be 155 ± 20 mb (1985HA40).

7. ${}^7\text{Li}(d, d){}^7\text{Li}$ $E_b = 16.6951$

The elastic scattering [$E_d = 0.4$ to 1.8 MeV] shows a marked increase in cross section for $E_d = 0.8$ to 1.0 MeV (perhaps related to ${}^9\text{Be}^*(17.30)$) and a conspicuous anomaly at $E_d = 1.0$ MeV, due to p-wave deuterons [${}^9\text{Be}^*(17.50)$]. The elastic scattering has also been studied for $E_d = 1.0$ to 2.6 MeV and 10.0 to 12.0 MeV: see (1979AJ01).

^d $\Gamma_\alpha + \Gamma_n = 380 \pm 50$ eV.

The cross section rises steeply from threshold to 95 mb at $E_d = 2.4$ MeV and then more slowly to ≈ 165 mb at $E_d = 4.1$ MeV. The t_0 yield curve ($\theta_{\text{lab}} = 155^\circ$) decreases monotonically for $E_d = 10.0$ to 12.0 MeV: see (1974AJ01).

$$Q_m = 11.2016$$

Observed proton groups are displayed in Table 9.5. The parameters for the particle and γ -decay of observed states are displayed in Tables 9.6 and 9.3. Angular distributions have been reported in the range $E({}^3\text{He}) = 0.9$ to 14 MeV [see (1974AJ01, 1979AJ01)] and at $E({}^3\vec{\text{He}}) = 14$ and 33 MeV (1983LE17, 1983RO22; p_0). ^b See also Table 9.3.

Angular distributions of d_0 , d_1 and d_2 have been reported at $E_\alpha = 30$ MeV: see (1974AJ01). See also (1983BE51; theor.).

11. ${}^7\text{Li}({}^6\text{Li}, \alpha){}^9\text{Be}$ $Q_m = 15.220$

Angular distributions of the α -groups to ${}^9\text{Be}^*(0, 2.43, 6.76)$ have been measured at $E({}^7\text{Li}) = 78$ MeV (1986GLZV: prelim.). For the excitation of ${}^4\text{He}^*$ see (1987GLZX; prelim.; $E({}^6\text{Li}) = 93$ MeV). For the earlier work see (1974AJ01).

12. ${}^9\text{Li}(\beta^-){}^9\text{Be}$ $Q_m = 13.606$

${}^9\text{Li}$ decays by β^- emission with $\tau_{1/2} = 178.3 \pm 0.4$ msec to several ${}^9\text{Be}$ states: see ${}^9\text{Li}$, reaction 1 and Table 9.7. Measurements of β - α coincidences involving ${}^9\text{Be}^*(11.28)$ show contributions from the direct $n + 2\alpha$ breakup process as well as the sequential n -emission to ${}^8\text{Be}^*(3.0)[J^\pi = 2^+]$, followed by breakup into 2α . The branching ratio for the ${}^9\text{Be}^*(2.43) \rightarrow {}^8\text{Be}_{\text{g.s.}} + n$ decay is $(6.4 \pm 1.2)\%$. ${}^9\text{Be}^*(2.78)[J^\pi = \frac{1}{2}^-]$ decays mainly to ${}^8\text{Be}_{\text{g.s.}} + n$, presumably by p-wave neutron emission: see (1979AJ01, 1984AJ01) for references, and (1988MI03) for a discussion of the evidence.

The photoneutron cross section has been measured from threshold to 320 MeV: see Table 9.6 in (1966LA04), (1979AJ01) and (1988DI02). A pronounced peak occurs ≈ 29 keV above threshold with $\sigma_{\text{max}} = 1.33 \pm 0.24$ mb. The shape of the resonance has been measured very accurately for $E_\gamma = 1675$ to 2168 keV. The FWHM of the peak is estimated to be 100 keV (1982FU11). See also (1983BA52; theor.) and (1987KU05). The cross section then decreases slowly to 1.2 mb at 40 keV above threshold. From bremsstrahlung studies, peaks in the (γ, Tn) cross section are observed corresponding to $E_x = 1.80$ and 3.03 MeV. At higher energies, using monoenergetic photons, the (γ, Tn) cross section is found to be relatively smooth from $E_\gamma = 17$ to 37 MeV with weak structures which correspond to $E_x = 17.1, 18.8, 19.9, 21.4, 22.4, 23.8$ [± 0.2] MeV and 27 ± 0.5 MeV (broad). In the range $E_\gamma = 18$ to 26 MeV the integrated (γ, n_0) cross section is < 0.1 MeV \cdot mb, that for $(\gamma, n_1) = 2.4 \pm 0.4$ MeV \cdot mb and the combined integrated cross section

^e Suggested on the basis of the branching ratios. These should be remeasured [see the ${}^9\text{C}(\beta^+)$ work of (1988MI03): reaction 9, in ${}^9\text{B}$]. F.C. Barker (private communication) suggests, on the basis of analog evidence, $J^\pi = (\frac{9}{2}, \frac{7}{2})^-$ for ${}^9\text{Be}^*(11.28)$.

for (γ, n) to ${}^8\text{Be}^*(16.6)$ and (γ, α_0) to ${}^5\text{He}_{\text{g.s.}}$ is 13.1 ± 2 MeV \cdot mb.

The total absorption cross section has been measured for $E_\gamma = 10$ to 210 MeV: it rises to ≈ 5 mb at ≈ 21 MeV, decreases to about 0 at 160 MeV and then increases to ≈ 1.5 mb at 210 MeV. An integrated cross section of 156 ± 15 MeV \cdot mb is reported for $E_\gamma = 10$ to 29 MeV as is resonant structure at $E_\gamma = 11.8, (13.5), 14.8, (17.3), (19.5), 21.0, (23.0),$ and (25.0) MeV. Fine structure is also reported at $E_\gamma = 20.47 \pm 0.04$ and 20.73 ± 0.04 MeV. See (1979AJ01) for references. At $E_\gamma = 1.58$ MeV, the cross section for reaction (c) is 0.40 ± 0.18 μb (1983FU13). For the electroproduction and photoproduction of helium nuclei for $E_e = 100$ to 225 MeV see (1986LI22). The yield shows structure in the energy region corresponding to the ${}^9\text{Be}$ levels at 17–19 MeV followed by the giant resonance at $E_\gamma \approx 23$ MeV ($\sigma = 2.64 \pm 0.30$ mb). Structure attributed to eleven states of ${}^9\text{Be}$ with $18.2 < E_x < 32.2$ MeV has also been reported. Integrated cross sections have been obtained for each of these resonances, and over different energy intervals for protons leading to ${}^8\text{Li}^*(0 + 0.98, 2.26 + 3.21, 9.0, 17.0)$. Angular and energy distributions of photoprotons in various energy intervals have been studied by many groups: see (1974AJ01) for references. For momentum spectra of protons using tagged photons with $E_\gamma = 360 \rightarrow 600$ MeV, see (1984BA09). See also (1984AJ01) and (1984HO24).

The integrated cross sections are reported to be 1.0 ± 0.5 MeV · mb ($E_\gamma = 21 \rightarrow 33$ MeV) for reaction (c) to ${}^7\text{Li}^*(0 + 0.4)$ and 0.6 ± 0.3 MeV · mb ($E_\gamma = 25 \rightarrow 33$ MeV) for reaction (d) to ${}^6\text{Li}(0)$. The total integrated cross section for $[(\gamma, p) + (\gamma, pn) + (\gamma, d) + (\gamma, t)]$ is 33 ± 3 MeV · mb. Resonances in the (γ, d) and (γ, t) cross sections corresponding to ${}^9\text{Be}^*(26.0 \pm 0.2)$ and ${}^9\text{Be}^*(32.2 \pm 0.3)$, respectively, have been reported: see (1974AJ01). For momentum spectra of deuterons and tritons at $E_\gamma = 360 \rightarrow 600$ MeV see (1986BA07). Cross sections have been measured in the region of the $\Delta(1232)$ resonance by (1984HO09) $[(\gamma, pn), (\gamma, 2p)]$, (1987KA13) $[(\gamma, p), (\gamma, pn), (\gamma, 2p)]$ and (1986AR06) $[(\gamma, \pi^0)]$. For a high energy study of hadron production see (1983AR24). See also (1986MC1G), (1985HO27, 1985MA1G) and (1983TR04, 1986HO11, 1987LU1B; theor.).

15. ${}^9\text{Be}(\gamma, \gamma){}^9\text{Be}$

The second $T = \frac{3}{2}$ state of ${}^9\text{Be}$ at $E_x = 16.98$ MeV has been studied in this reaction: see Table 9.4 and reaction 4 (1987ZI01). See also (1986ZI01). With $E_{\text{bs}} = 31$ MeV eight resonances in (γ, γ') are reported for $17.4 < E_x < 29.4$ MeV (1984AL22).

$$b = 1.5_{-0.2}^{+0.3} \text{ fm} [b=\text{oscillator parameter}]$$

$\langle r^2 \rangle_M^{1/2} = 3.2 \pm 0.3 \text{ fm}; \Omega = 6 \pm 2 \mu_N \cdot \text{fm}^2$ [this value of the magnetic octupole moment implies a deformation of the average nuclear potential].

The elastic scattering of electrons has been studied for E_e up to 700 MeV. Magnetic elastic scattering gives indications of both M1 and M3 contributions. Inelastic scattering populates a number of levels: see Table 9.8. At $E_e = 45$ and 49 MeV ${}^9\text{Be}^*(1.68)$ has a strongly asymmetric

line shape, as expected from its closeness to the ${}^8\text{Be}+n$ threshold. The form factor is dominated by a $0p_{3/2} \rightarrow 1s_{1/2}$ particle-hole transition. ${}^9\text{Be}^*(2.43)$ is strongly excited (1987KU05). Form factors have also been measured for ${}^9\text{Be}^*(0, 14.39, 16.67, 16.98, 17.49)$ by (1983LO11; $E_e = 100.0$ to 270.2 MeV). See also (1986MA48, 1987HY01, 1985HY1A). (1984WO09) suggest that the $T = \frac{1}{2}$ states [${}^9\text{Be}^*(16.67, 17.49)$] have $J^\pi = \frac{5}{2}^+$ and $\frac{7}{2}^+$, respectively, and that they have large parentage amplitudes with ${}^8\text{Be}^*(16.6+16.9)$ [$J^\pi = 2^+$], rather than with ${}^8\text{Be}_{g.s.}$. See (1974AJ01, 1979AJ01, 1984AJ01) for other work and earlier references.

Peaks are observed for the quasifree reaction and for the Δ -resonance at 72 ± 3 and 315 ± 20 MeV at $E_e = 537$ MeV, and at 115 ± 5 and 375 ± 10 MeV at $E_e = 730$ MeV. The FWHM widths for the quasifree reaction peaks are 80 ± 5 and 115 ± 5 MeV at $E_e = 537$ and 730 MeV (1984OC01, 1987OC01). For the deep inelastic cross sections at very high energies see (1984AR02). A parity-violation study using polarized 300 MeV electrons is reported by (1987OT1C; prelim.). 17. ${}^9\text{Be}(\pi^\pm, \pi^\pm){}^9\text{Be}$

The elastic scattering, and inelastic scattering to ${}^9\text{Be}^*(2.43, 6.76)$ have been studied at $E_{\pi^\pm} = 162$ and 291 MeV. Quadrupole contributions appear to be quite important for the elastic scattering at 162 MeV, but are much less so at the higher energy: see (1984AJ01) and the ‘‘General’’ section here.

(b) ${}^9\text{Be}(n, 2n){}^8\text{Be}$ $Q_m = -1.6654$

The population of ${}^9\text{Be}^*(0, 1.7, 2.4, 3.1, (6.8))$ has been reported in this reaction: see (1974AJ01). For the neutron decay of these states see Table 9.6. Angular distributions have been measured at $E_n = 3.5$ to 14.93 MeV [see (1974AJ01, 1979AJ01, 1984AJ01)], at $E_n = 7$ to 15 MeV (1983DA22; n_0), 11 to 17 MeV (1985TE01; n_0, n_2), 14.6 MeV (1985HA02, 1986HAYU; n_0) and 14.7 MeV (1984SH01; n_0, n_2) as well as at $E_n = 9$ to 17 MeV (1984BY03; n_0, n_2 ; see also for transition to ${}^9\text{Be}^*(6.76)$). 19. ${}^9\text{Be}(p, p){}^9\text{Be}$

Elastic and inelastic angular distributions have been studied at many energies in the range $E_p = 2.3$ to 1000 MeV [see (1974AJ01, 1979AJ01, 1984AJ01)], at $E_p = 2.31$ to 2.73 MeV (1983AL10;

^e The group may consist of two unresolved states, the second one reached by an M1 transition [$J^\pi = (\frac{1}{2})^-$] with $\Gamma_{\gamma_0} = 0.18 \pm 0.09$ eV. I am indebted to Dr. L.W. Fagg for his help in understanding this point.

p_0), 11 to 17 MeV (1986MU07; p_0) and 1 GeV (1985AL16; p_0) as well as at $E_{\bar{p}} = 200$ MeV (1985GLZZ; p_0 ; prelim.) and 220 MeV (1985RO15; p_0, p_2). The elastic distributions show pronounced diffraction maxima. A quadrupole-deformed optical-model potential is necessary to obtain a good fit to the p_0 and p_2 angular distributions: see (1974AJ01). The spin-flip probability at $E_{\bar{p}} = 31$ MeV is ≈ 0 for the p_2 group, which is expected in view of the collective nature of the transition (1981CO08).

The structure corresponding to ${}^9\text{Be}^*(1.7)$ is asymmetric, as expected: see reaction 16 and Table 9.8 for its parameters. [At $E_p = 13$ MeV the spectra are dominated by ${}^9\text{Be}^*(2.43)$ (1987KU05)]. The weighted mean of the values of E_x for ${}^9\text{Be}^*(2.4)$ listed in (1974AJ01) is 2432 ± 3 keV. ${}^9\text{Be}^*(3.1)$ has $E_x = 3.03 \pm 0.03$ MeV, $\Gamma = 250 \pm 50$ keV, $J^\pi = \frac{3}{2}^+, \frac{5}{2}^+$. Higher states are observed at $E_x = 4.8 \pm 0.2, 6.76 \pm 0.06$ [$J^\pi = \frac{1}{2}^+, \frac{5}{2}^+, \frac{7}{2}^+$ (but see below), $\Gamma = 1.2 \pm 0.2$ MeV], 7.94 ± 0.08 ($\Gamma \approx 1$ MeV), 11.3 ± 0.2 MeV ($\Gamma \approx 1$ MeV), 14.4 ± 0.3 ($\Gamma \approx 1$ MeV), $16.7 \pm 0.3, 17.4 \pm 0.3, 19.0 \pm 0.4, 21.1 \pm 0.5$ and 22.4 ± 0.7 MeV [the five highest states are all broad]. For ${}^9\text{Be}^*(2.4, 6.8)$

$B(E2\uparrow) = 49 \pm 6$ and 24 ± 4 fm⁴ and $\Gamma(E2\downarrow) = 0.0025$ and 0.10 eV, respectively. The strong population of ${}^9\text{Be}^*(2.4, 6.8)$ is consistent with the assumption that they have $J^\pi = \frac{5}{2}^-$ and $\frac{7}{2}^-$, respectively, and are members of the ground state $K = \frac{3}{2}^-$ band. See (1966LA04, 1974AJ01) for references. For K^+ production see (1986AB07). The reactions $(p, 2p)X$ and $(p, pd)X$ have been studied at $E_p = 300$ MeV (1983GR21, 1984HE03). For reactions (a) and (c) see also ${}^8\text{Li}, {}^8\text{Be}$ (1985BE30, 1985DO16; 1 GeV) and (1984AJ01). Reaction (c) at $E_p = 10 - 24$ MeV involves ${}^9\text{Be}^*(3.0, 4.7)$: see (1984AJ01). See also (1984WA21). For reactions (b) and (d) at $E_p = 58$ MeV see ${}^7\text{Li}, {}^6\text{Li}$ and (1985DE17, 1984DE1F). For reactions (e) and (f) see (1985PAZL; $E_{\bar{p}} = 70$ MeV). The $(p, p\alpha)$ process (reaction (f)) has been studied at $E_p = 150.5$ MeV (1985WA13; see for S_α). For inclusive proton spectra yields see (1985SE15). 21. ${}^9\text{Be}(d, d){}^9\text{Be}$

Angular distributions have been measured in the range 1.0 to 410 MeV [see (1974AJ01, 1979AJ01, 1984AJ01)] and at $E_d = 2.0$ to 2.8 MeV (1983DE50, 1984AN16). See also ^{11}B in (1990AJ01).

Inelastic groups have been reported to $^9\text{Be}^*(1.7, 4.7, 6.8)$ and to states with $E_x = 2431.9 \pm 7.0$ keV and 3040 ± 15 keV ($\Gamma = 294 \pm 20$ keV): see (1974AJ01).

22. (a) $^9\text{Be}(t, t)^9\text{Be}$

(b) $^9\text{Be}(t, nt)^8\text{Be}$ $Q_m = -1.6654$

Angular distributions of elastically scattered tritons have been measured at $E_t = 2.10$ MeV and at $E_{\bar{t}} = 15$ and 17 MeV: see (1974AJ01, 1984AJ01). Reaction (b) at 4.2 and 4.6 MeV proceeds via $^9\text{Be}^*(2.4)$: see (1974AJ01).

23. (a) $^9\text{Be}(^3\text{He}, ^3\text{He})^9\text{Be}$

(b) $^9\text{Be}(^3\text{He}, 2\alpha)^4\text{He}$ $Q_m = 19.0043$

Angular distributions have been studied for $E(^3\text{He}) = 1.6$ to 46.1 MeV and at 217 MeV [see (1974AJ01, 1979AJ01, 1984AJ01)]. At $E(^3\text{He}) = 39.8$ MeV, $^9\text{Be}^*(1.7, 2.4, 3.1, 4.7, 6.8, 14.4)$ are populated.

Reaction (b) has been studied in a kinematically complete experiment for $E(^3\text{He}) = 3$ to 12 MeV (1986LA26) and 11.9 to 24.0 MeV (1987WA25). For the earlier work see (1984AJ01). See also (1987TR01; theor.).

24. (a) $^9\text{Be}(\alpha, \alpha)^9\text{Be}$

(b) $^9\text{Be}(\alpha, 2\alpha)^5\text{He}$ $Q_m = -2.47$

Angular distributions have been studied at many energies in the range $E_\alpha = 5.0$ to 104 MeV [see (1974AJ01, 1984AJ01)] and $E_\alpha = 23.1$ MeV (1984HU1D, 1985HU1B; α_0, α_2). At $E_\alpha = 35.5$ MeV, states belonging to the $K = \frac{3}{2}^-$ ground-state band are strongly excited [$^9\text{Be}^*(0, 2.43, 6.76, 11.28)$]; it is suggested that the latter has $J^\pi = (\frac{9}{2}^-)$; see, however, reaction 12]. The first three states belonging to the $K = \frac{1}{2}^+$ band are also excited [$^9\text{Be}^*(1.68, 3.05, 4.70)$] (1982PE03; coupled channels analysis). For reaction (b) see (1983ZH09; 18 MeV); $S_\alpha = 0.96$ [see (1984AJ01)] and (1987WA25; $E(^3\text{He}) = 12$ to 24 MeV). See also ^8Be , (1987BU27, 1987KO1K) and (1984LI28, 1985SR01; theor.).

Elastic angular distributions have been measured for many of these reactions: see (1979AJ01, 1984AJ01). Recently they have been studied on ${}^{26}\text{Mg}$ and ${}^{40}\text{Ca}$ at $E({}^9\text{Be}) = 43$ and 45 MeV, respectively (1985WI18) and on ${}^{26}\text{Mg}, {}^{27}\text{Al}$ and ${}^{40}\text{Ca}$ at $E({}^9\text{Be}) = 158.1$ – 158.3 MeV (1984FU10). For pion production in reaction (a) see (1985FR13). The interaction cross section for 790 MeV/ A ${}^9\text{Be}$ on ${}^{27}\text{Al}$ has been measured by (1985TA18). Breakup measurements involving ${}^{40}\text{Ca}$ are reported by (1984GR20). See also (1983BI13, 1984FR1A, 1984HA53) and (1984GU09, 1985AN16, 1985BL18; theor.).

32. ${}^{10}\text{Be}(\text{d}, \text{t}){}^9\text{Be} \quad Q_{\text{m}} = -0.5547$

Forward angular distributions have been obtained at $E_{\text{d}} = 15.0$ MeV for the tritons to ${}^9\text{Be}^*(0, 1.7, 2.4, 3.1)$. The ground-state transition is well fitted by $l = 1$. The transition to ${}^9\text{Be}^*(1.7)$ [$\approx 165 \pm 25$ keV] is consistent with $J^{\pi} = \frac{1}{2}^+$, that to ${}^9\text{Be}^*(2.4)$ is quite well fitted with $l = 3$ [$J^{\pi} = \frac{5}{2}^-$], and that to ${}^9\text{Be}^*(3.1)$ [$\Gamma = 280 \pm 25$ keV] is consistent with $l = 2$. No other narrow states are seen up to $E_{\text{x}} = 5.5$ MeV: see (1974AJ01).

33. ${}^{10}\text{B}(\text{n}, \text{d}){}^9\text{Be} \quad Q_{\text{m}} = -4.3612$

See (1974AJ01) and ^{11}B in (1980AJ01).

$$34. \text{}^{10}\text{B}(\text{p}, 2\text{p})\text{}^9\text{Be} \quad Q_{\text{m}} = -6.5857$$

See (1974AJ01) and (1985BE30, 1985DO16).

$$35. \text{}^{10}\text{B}(\text{d}, \text{}^3\text{He})\text{}^9\text{Be} \quad Q_{\text{m}} = -1.0922$$

Angular distributions of the ^3He groups corresponding to $^9\text{Be}^*(0, 2.4)$ have been studied at $E_{\text{d}} = 11.8, 28$ and 52 MeV [the latter also to $^9\text{Be}^*(6.7)$], and at $E_{\text{d}} = 15$ MeV: $S = 0.72$ and 0.82 for $^9\text{Be}^*(0, 2.4)$. At $E_{\text{d}} = 52$ MeV $^9\text{Be}^*(11.3)$ appears to be strongly populated: see (1979AJ01).

$$36. \text{}^{10}\text{B}(\text{t}, \alpha)\text{}^9\text{Be} \quad Q_{\text{m}} = 13.2283$$

At $E_{\text{t}} = 12.9$ MeV α -groups are observed to the ground state of ^9Be and to excited states at $E_{\text{x}} = 1.75 \pm 0.03, 2.43, 3.02 \pm 0.04$ ($\Gamma = 320 \pm 60$ keV), 11.27 ± 0.04 ($\Gamma = 530 \pm 70$ keV), (14.4) [$\Gamma \approx 800$ keV], 14.39 and 16.67 MeV. The $T = \frac{3}{2}$ state $^9\text{Be}^*(14.39)$ is very weakly populated [$\approx 5\%$ of intensity of α_2]. The angular distribution of the α_2 group shows sharp forward and backward peaking. The α_0 group is not peaked in the backward direction: see (1979AJ01). See also (1984AJ01) and (1982CI1A; theor.).

$$37. \text{}^{11}\text{B}(\text{p}, \text{}^3\text{He})\text{}^9\text{Be} \quad Q_{\text{m}} = -10.3218$$

At $E_{\text{p}} = 45$ MeV angular distributions are reported for the ^3He ions corresponding to $^9\text{Be}^*(0, 2.4, 11.8, 13.8, 14.39)$ [$T = \frac{3}{2}$], 15.96 ± 0.04 [$T = \frac{1}{2}$]. In addition one or more states may be located at $^9\text{Be}^*(15.13)$. It is suggested that $^9\text{Be}^*(11.8, 13.8, 15.96)$ are the $J^{\pi} = \frac{3}{2}^{-}, T = \frac{1}{2}$ analogs to $^9\text{Be}^*(12.06, 14.01, 16.02)$. Angular distributions are also reported at $E_{\text{p}} = 40$ MeV. The intensity of the group to $^9\text{Be}^*(3.1)$ is $\approx 1\%$ of the ground-state group at that energy: see (1974AJ01). The excitation energy of the first $T = \frac{3}{2}$ state is $E_{\text{x}} = 14392.2 \pm 1.8$ keV (1974KA15), using Q_{m} .

$$38. \text{(a) } \text{}^{11}\text{B}(\text{d}, \alpha)\text{}^9\text{Be} \quad Q_{\text{m}} = 8.0314$$

$$\text{(b) } \text{}^{11}\text{B}(\text{d}, n\alpha)2 \text{}^4\text{He} \quad Q_{\text{m}} = 6.4579$$

Alpha groups are reported corresponding to ${}^9\text{Be}^*(0, 1.7, 2.4, 3.1)$. The width of ${}^9\text{Be}^*(1.7)$ [$E_x = 1.70 \pm 0.01$ MeV] is $\Gamma_{\text{c.m.}} = 220 \pm 20$ keV. The weighted mean of the values of E_x of ${}^9\text{Be}^*(2.4)$, reported in (1974AJ01), is 2425 ± 3 keV. The $\frac{5}{2}^+$ state is at $E_x = 3.035 \pm 0.025$ MeV: $\Gamma_{\text{c.m.}} = 257 \pm 25$ keV. The ratio Γ_γ/Γ of ${}^9\text{Be}^*(1.7) \leq 2.4 \times 10^{-5}$, that for ${}^9\text{Be}^*(2.4)$ is reported to be $(1.16 \pm 0.14) \times 10^{-4}$. Since Γ_γ is known from (e, e') [see Table 9.8: 0.089 ± 0.010 eV], $\Gamma = 0.77 \pm 0.15$ keV. See (1974AJ01, 1979AJ01) for references.

Angular distributions for α_0 and α_2 are reported at $E_d = 0.39$ to 3.9 MeV and at 12 MeV [see (1974AJ01, 1979AJ01)]. Reaction (b), at $E_d = 10.4$ and 12.0 MeV, proceeds via ${}^9\text{Be}^*(2.4)$ and to some extent via ${}^9\text{Be}^*(3.1, 4.7)$ and possibly some higher excited states. The dominant decay of ${}^9\text{Be}^*(2.4)$ is to ${}^5\text{He}(0) + \alpha$ while ${}^9\text{Be}^*(3.1, 4.7)$ decay to ${}^8\text{Be}(0) + n$. It should be noted, however, that the peaks corresponding to ${}^9\text{Be}^*(3.0)$ have a FWHM of ≈ 1 MeV, which may imply that ${}^9\text{Be}^*(2.8)$ is involved.

$$\text{(b) } {}^{12}\text{C}(n, n\alpha)2 {}^4\text{He} \quad Q_m = -7.2747$$

Angular distributions of the α_0 group have been measured at $E_n = 13.9$ to 18.8 MeV [see (1974AJ01)] and at 14.1 MeV (1984HA48). ${}^9\text{Be}^*(1.7, 2.4, 3.1, 6.8)$ are also populated. Reaction (b) at $E_n = 13$ to 18 MeV involves ${}^9\text{Be}^*(2.4)$. See (1984HA48) for differential cross sections at 14.1 MeV and for partial and total cross sections.

The 90° yields of γ_0 and of γ to ${}^9\text{B}^*(2.36)$ (reaction (a)) have been measured for $E({}^3\text{He}) = 0.6$ to 1.2 MeV [as have the 2α -particles from the decay of ${}^8\text{Be}^*(16.6)$ (reaction (c))]: they are reported to show a resonance at $E({}^3\text{He}) = 765 \pm 5$ keV [${}^9\text{B}^*(17.111)$], attributed to ${}^9\text{B}^*(17.076)$ [$T = \frac{3}{2}$]. The total cross section for reaction (b) increases monotonically from threshold to ≈ 7 mb at 3.8 MeV. It then decreases monotonically from $E({}^3\text{He}) = 5.5$ to 7.6 MeV and also from 8.9 to 26.5 MeV: see (1979AJ01, 1984AJ01), and ${}^8\text{B}$.

Absolute cross sections for protons (reaction (c)) to ${}^8\text{Be}^*(0, 2.9, 16.6, 16.9)$ as well as for the continuum protons have been measured for $E({}^3\text{He}) = 0.5$ to 1.85 MeV. Reaction rate parameters, $\langle\sigma v\rangle$, have been calculated for $kT = 0.01$ to 10.0 MeV. Excitation functions for p_0 and p_1 have been measured for $E({}^3\text{He}) = 0.9$ to 17 MeV, and polarization measurements are reported at $E({}^3\text{He}) = 14$ MeV. Resonances are observed at $E({}^3\text{He}) = 1.6$ and 3.0 MeV [$\Gamma = 0.25$ and 1.5 MeV]: see (1974AJ01, 1979AJ01), and ${}^8\text{Be}$. Polarization measurements are also reported at $E({}^6\bar{\text{Li}}) = 21$ MeV (VAP; p_0). In the range $E({}^3\text{He}) = 0.7$ to 2.0 MeV, a resonance in the excitation function for deuterons (reaction (d)) is reported corresponding to ${}^9\text{B}^*(17.6)$. Polarization

measurements at $E(^3\vec{\text{He}}) = 33.3$ MeV for the d_0 and d_1 groups are reported. Excitation functions for t_0 (reaction (e)) have been measured for $E(^3\text{He}) = 10$ to 16 and 23.3 to 25.4 MeV: see (1974AJ01). Polarization measurements are reported at $E(^3\vec{\text{He}}) = 33.3$ MeV for the t_0 group as well as for the ^3He ions to $^6\text{Li}^*(0, 2.19)$ (reaction (f)). The elastic scattering has also been studied for $E(^3\text{He}) = 0.7$ to 2.0 MeV. The α - α coincidences ($^5\text{Li}_{\text{g.s.}}$ decay) (reaction (g)) have been measured for $E(^3\text{He}) = 1.4$ to 1.8 MeV: a resonance is observed at 1.57 ± 0.02 MeV [$^9\text{B}^*(17.63)$], $\Gamma = 70 \pm 20$ keV. Polarization measurements of the α -particles to $^5\text{Li}^*(0, 16.7)$ are reported at $E(^3\vec{\text{He}}) = 33.3$ MeV. For a study of the $(^3\text{He}, p\alpha)^4\text{He}$ reaction at 3.5, 4.4 and 5.5 MeV see (1987ZA07). See (1979AJ01, 1984AJ01) for references.

$$2. \ ^6\text{Li}(\alpha, n)^9\text{B} \quad Q_{\text{m}} = -3.977$$

At $E_{\alpha} = 28$ and 32 MeV angular distributions have been measured to $^9\text{B}^*(0, 2.36)$ (1985GUZQ; prelim.). See also (1974AJ01).

$$3. \ ^6\text{Li}(^6\text{Li}, t)^9\text{B} \quad Q_{\text{m}} = 0.806$$

Angular distributions of the t_0 group have been measured for $E(^6\text{Li}) = 4.0$ to 5.5 MeV and at 7.35 and 9.0 MeV. No evidence was observed for a group corresponding to $^9\text{B}^*(1.6)$: see (1974AJ01).

$$4. \ ^7\text{Li}(^3\text{He}, n)^9\text{B} \quad Q_{\text{m}} = 9.351$$

For $E(^3\text{He})$ to 12.5 MeV this reaction populates $^9\text{B}^*(0, (1.6), 2.4, 2.8, (7.0))$, and states at $E_{\text{x}} = 4.8 \pm 0.1$ MeV [1.0 ± 0.2 MeV], 12.06 ± 0.06 [0.8 ± 0.2], 14.01 ± 0.07 [0.39 ± 0.11], 14.657 ± 0.005 (based on Q_{m}) [< 0.045], 16.024 ± 0.025 [0.180 ± 0.016], 17.19 and 17.63 MeV [Γ in brackets]: see (1974AJ01). $^9\text{B}^*(14.66)$ is the first $T = \frac{3}{2}$ state in ^9B . Its decay properties are displayed in Table 9.3 and compared with those of $^9\text{Be}^*(14.40)$: see reaction 9 in ^9Be and (1974AJ01). Angular distributions have been measured at $E(^3\text{He}) = 1.56$ to 5.27 MeV: see (1974AJ01).

$$5. \text{ (a) } ^7\text{Be}(d, n)^8\text{B} \quad Q_{\text{m}} = -2.087 \quad E_{\text{b}} = 16.489$$

$$\text{ (b) } ^7\text{Be}(d, p)^8\text{Be} \quad Q_{\text{m}} = 16.6740$$

The cross section for reaction (a) for $E(^7\text{Be}) = 16.9$ MeV is 58 ± 11 mb (1983HA17, 1985HA40). For $E_{\text{d}} = 0.75$ to 1.70 MeV, resonances in the yields of protons are observed at $E_{\text{d}} = 0.900 \pm 0.025$ MeV (p_0, p_1) and 1.475 ± 0.010 MeV (p_1 only) with $\Gamma_{\text{c.m.}} = 120 \pm 40$ and 71 ± 8 keV, respectively [$^9\text{B}^* = 17.19$ and 17.64 MeV]: see (1974AJ01). See also (1985CA41; astrophys.).

 (b) ${}^9\text{Be}(p, pn){}^8\text{Be}$ $Q_m = -1.6654$

Angular distributions have been reported at many energies in the range $E_p = 3.5$ to 49.3 MeV [see (1979AJ01, 1984AJ01)] and at 16.44 and 17.57 MeV (1986MU07; n_0).

The width of the ground state is 0.54 ± 0.21 keV: see (1974AJ01). At $E_p = 135$ MeV, neutron groups are reported to states at $0, 2.36, 2.71 \pm 0.1$ [$\Gamma = 0.7 \pm 0.1$ MeV], 2.75 ± 0.3 [3.1 ± 0.2], 4.3 ± 0.2 [1.6 ± 0.2], 12.23 ± 0.1 [0.5 ± 0.1], 13.96 ± 0.1 [not broad] and 14.60 ± 0.1 [0.6 ± 0.1] MeV ((1985PU1A); Ph.D. thesis quoted and discussed in (1988MI03)) [Γ in MeV]. For the earlier work see (1979AJ01, 1984AJ01). Reaction (b) does not seem to involve states of ${}^9\text{B}$. See also (1984BA1R, 1988BO47, 1988HE08), (1984ALYS, 1987VO1F; applications), (1983BY02, 1987RA32) and (1982GU13; theor.). For yield and polarization measurements see ${}^{10}\text{B}$.

7. ${}^9\text{Be}({}^3\text{He}, t){}^9\text{B}$ $Q_m = -1.087$

Angular distributions have been measured for $E({}^3\text{He}) = 3.0$ to 25 MeV and at 217 MeV: see (1974AJ01, 1979AJ01). At $E({}^3\text{He}) = 39.8$ MeV, ${}^9\text{B}_{\text{g.s.}}$ is strongly populated and ${}^9\text{B}^*(2.4, 14.7)$ are also observed: see (1974AJ01). At $E({}^3\text{He}) = 90$ MeV triton groups are reported to states at $E_x = 1.16 \pm 0.05$ [1.3 ± 0.05], 4.8 ± 0.03 [1.5 ± 0.3], 16.7 ± 0.1 [< 0.1], 18.6 ± 0.3 and 20.7 ± 0.5 [1.6 ± 0.3] MeV [Γ in MeV], in addition to ${}^9\text{B}^*(2.36, 2.79, 7.0)$ and unresolved states at higher E_x (1987KA36). See also (1983DJZV).

8. (a) ${}^9\text{Be}({}^6\text{Li}, {}^6\text{He}){}^9\text{B}$ $Q_m = -4.575$
 (b) ${}^9\text{Be}({}^7\text{Li}, {}^7\text{Be}){}^9\text{B}$ $Q_m = -1.930$

At $E({}^6\text{Li}) = 32$ MeV angular distributions are reported to ${}^9\text{B}^*(0, 2.36)$ (1985CO09). A weak group between these two may have been populated (1987BUZZ; prelim.). See also (1984GL06; $E({}^6\text{Li}) = 93$ MeV, $E({}^7\text{Li}) = 78$ MeV).

9. ${}^9\text{C}(\beta^+){}^9\text{B}$ $Q_m = 16.498$

The β^+ decay is observed to ${}^9\text{B}^*(0, 2.36, 2.8)$ [$J^\pi = \frac{3}{2}^-, \frac{5}{2}^-, \frac{1}{2}^-$] with branching ratios of (60 ± 10) , (17 ± 6) and $(11 \pm 5)\%$. A state at $E_x = 12.1 \pm 0.6$ MeV, $\Gamma = 0.4 \pm 0.1$ MeV is also observed. The remaining strength goes to it (1988MI03; and D. Mikolas, priv. comm.). See also (1988MI1G). For an earlier study on delayed protons observed in the decay of ${}^9\text{C}$ see reaction 9 and Table 9.10 in (1974AJ01).

$$10. \text{ (a) } {}^{10}\text{B}(\text{p}, \text{d}){}^9\text{B} \quad Q_m = -6.212$$

$$\text{ (b) } {}^{10}\text{B}(\text{p}, \text{pn}){}^9\text{B} \quad Q_m = -8.436$$

Angular distributions are reported at $E_p = 18.6$ MeV involving ${}^9\text{B}^*(0, 2.36)$ (1985BE13). For other observed groups see Table 9.10. For reaction (b) see (1985BE30, 1985DO16; $E_p = 1$ GeV; prelim.). See also (1988GUZW).

$$11. {}^{10}\text{B}(\text{d}, \text{t}){}^9\text{B} \quad Q_m = -2.179$$

Angular distributions have been measured at $E_d = 11.8$ to 28 MeV [see (1974AJ01, 1979AJ01)] and 18 MeV (1988GO02; to ${}^9\text{B}^*(0, 2.36)$). See also (1983DJZV), (1988GUZW) and (1984SHZJ; theor.).

$$12. \text{ (a) } {}^{10}\text{B}({}^3\text{He}, \alpha){}^9\text{B} \quad Q_m = 12.141$$

$$\text{ (b) } {}^{10}\text{B}({}^3\text{He}, \alpha\text{p}){}^8\text{Be} \quad Q_m = 12.3267$$

$$\text{ (c) } {}^{10}\text{B}({}^3\text{He}, 2\alpha){}^5\text{Li} \quad Q_m = 10.45$$

Alpha-particle spectra show the excitation of ${}^9\text{B}^*(0, 2.4, 2.8, 11.8)$: see (1966LA04). $E_x = 2.361 \pm 0.005$ and 2.788 ± 0.030 MeV, $\Gamma = 81 \pm 5$ and 548 ± 40 keV, respectively. There is some evidence for a state with $E_x \approx 1.6$ MeV, $\Gamma \approx 0.7$ MeV, but it is not conclusive. No evidence

is found for any narrow levels in ${}^9\text{B}$ with $\Gamma \leq 100$ keV and $4 < E_x < 7$ MeV: the upper limit to the intensity of the corresponding α -group is 1% of the intensity of the group to ${}^9\text{B}^*(2.4)$. Angular distributions have been determined at $E({}^3\text{He}) = 5.5$ and 33.7 MeV [see (1974AJ01)] and at $E({}^3\text{He}) = 22.7$ MeV (1987VA11; to ${}^9\text{B}^*(0, 2.36)$; prelim.).

In reaction (b) study of the decays of ${}^9\text{B}^*(2.4, 2.8)$ shows that ${}^9\text{B}^*(2.4)$ decays $< 0.5\%$ by proton emission to ${}^8\text{Be}(0)$ [it decays to ${}^5\text{Li}(0)$ by α -emission] while the second state, $E_x = 2.71 \pm 0.03$ MeV [$\Gamma = 0.71 \pm 0.06$ MeV], decays almost 100% by that channel [$\theta^2 = 0.74$]. No other excited states of ${}^9\text{B}$ with $3.5 < E_x < 9.5$ MeV decay by proton emission to ${}^8\text{Be}(0)$: see (1974AJ01). In a kinematically complete experiment (reaction(c)) at $E({}^3\text{He}) = 2.3$ and 5.0 MeV, the E_x of ${}^9\text{B}^*(4.8)$ is estimated to be 4.9 ± 0.2 MeV, and its width to be 1.5 ± 0.3 MeV (1986AR14). A preliminary report of a study of reactions (b) and (c) at $E({}^3\text{He}) = 2.3$ and 5 MeV suggests $E_x = 1.8 \pm 0.3$ MeV, $\Gamma = 0.9 \pm 0.3$ MeV (1988AR05). See also (1983DJZV) and (1988GOZB; theor.).

13. ${}^{11}\text{B}(\text{p}, \text{t}){}^9\text{B}$ $Q_m = -11.409$

At $E_p = 45$ MeV angular distributions have been obtained for the triton groups to ${}^9\text{B}^*(0, 2.36, 12.06, 14.01, 14.66, 16.02)$. In addition the spectra show some indication of the groups corresponding to ${}^9\text{B}^*(7.0, 17.19, 17.64)$. $T = \frac{1}{2}$ states are reported at $E_x = 15.29 \pm 0.04$ and 15.58 ± 0.04 MeV. The first two $T = \frac{3}{2}$ states have been observed at $E_x = 14.6550 \pm 0.0025$ and 17.076 ± 0.004 MeV [$\Gamma = 22 \pm 5$ keV]: see (1974AJ01, 1979AJ01). See also (1987KW01; theor.).

14. (a) ${}^{12}\text{C}(\text{p}, \alpha){}^9\text{B}$ $Q_m = -7.552$
 (b) ${}^{12}\text{C}(\text{p}, \text{p})3\text{ }{}^4\text{He}$ $Q_m = -7.27473$
 (c) ${}^{12}\text{C}(\text{p}, \text{pt}){}^9\text{B}$ $Q_m = -27.366$

Angular distributions have been measured at $E_p = 14.0$ to 54.1 MeV [see (1974AJ01)] and at $E_p = 42.8$ MeV (1983PE07; to ${}^9\text{B}^*(0, 2.36, 6.98)$). The transitions to these three states involve $L = 1, 3$ and 3 , respectively (1983PE07). Earlier work is consistent with $J^\pi = \frac{7}{2}^-$, $\Gamma = 2$ MeV, $E_x = 6.97 \pm 0.06$ MeV. A state at 2.9 ± 0.2 MeV has also been reported: see (1974AJ01). Angular distributions involving the α_0 and α^* groups [to ${}^4\text{He}^*(20.1), 0^+$] to ${}^9\text{B}_{\text{g.s.}}$ have been studied at $E_p = 42$ MeV: see (1984AJ01). For reaction (c) see (1985DE17; $E_p = 58$ MeV). See also (1984AJ01) and (1985MAZG, 1986GO28, 1987GA08; theor.).

15. ${}^{12}\text{C}({}^3\text{He}, {}^6\text{Li}){}^9\text{B}$ $Q_m = -11.570$

Angular distributions have been studied at $E({}^3\text{He}) = 30.0$ and 40.7 MeV [see (1974AJ01)] and at $E({}^3\text{He}) = 33.4$ MeV (1986CL1B; to ${}^9\text{B}^*(0, 2.36)$; also A_y ; prelim.).

16. ${}^{12}\text{C}(\alpha, {}^7\text{Li}){}^9\text{B}$ $Q_m = -24.898$

Angular distributions have been measured at $E_\alpha = 49.0$ and 80.1 MeV (1984GO03). See also (1984AJ01).

Fig. 4: Isobar diagram, $A = 9$. The diagrams for individual isobars have been shifted vertically to eliminate the neutron-proton mass difference and the Coulomb energy, taken as $E_C = 0.60Z(Z - 1)/A^{1/3}$. Energies in square brackets represent the (approximate) nuclear energy, $E_N = M(Z, A) - ZM(\text{H}) - NM(\text{n}) - E_C$, minus the corresponding quantity for ${}^9\text{Be}$: here M represents the atomic mass excess in MeV. Levels which are presumed to be isospin multiplets are connected by dashed lines.
