

Energy Levels of Light Nuclei $A = 15$

F. Ajzenberg-Selove

University of Pennsylvania, Philadelphia, Pennsylvania 19104-6396

Abstract: An evaluation of $A = 13-15$ was published in *Nuclear Physics A523* (1991), p. 1. This version of $A = 15$ differs from the published version in that we have corrected some errors discovered after the article went to press. The introduction and introductory tables have been omitted from this manuscript. [Reference](#) key numbers have been changed to the NNDC/TUNL format.

(References closed July 1, 1990)

The original work of Fay Ajzenberg-Selove was supported by the US Department of Energy [DE-FG02-86ER40279]. Later modification by the TUNL Data Evaluation group was supported by the US Department of Energy, Office of High Energy and Nuclear Physics, under: Contract No. DEFG05-88-ER40441 (North Carolina State University); Contract No. DEFG05-91-ER40619 (Duke University).

Table of Contents for $A = 15$

Below is a list of links for items found within the PDF document. The introductory [Table 2](#) is available on this website via the link.

A. Nuclides: [\$^{15}\text{Li}\$](#) , [\$^{15}\text{Be}\$](#) , [\$^{15}\text{B}\$](#) , [\$^{15}\text{C}\$](#) , [\$^{15}\text{N}\$](#) , [\$^{15}\text{O}\$](#) , [\$^{15}\text{F}\$](#)

B. Tables of Recommended Level Energies:

[Table 15.1](#): Energy levels of ^{15}C

[Table 15.4](#): Energy levels of ^{15}N

[Table 15.16](#): Energy levels of ^{15}O

[Table 15.22](#): Energy levels of ^{15}F

C. [References](#)

D. Figures: [\$^{15}\text{C}\$](#) , [\$^{15}\text{N}\$](#) , [\$^{15}\text{O}\$](#) , [Isobar diagram](#)

E. Erratum to the Publication: [PS](#) or [PDF](#)

¹⁵Li
(Not illustrated)

¹⁵Li has not been observed. Its atomic mass excess is calculated to be 81.60 MeV: see (1981AJ01). It is then unstable with respect to decay into ¹⁴Li+n and ¹³Li+2n by 1.2 and 5.1 MeV, respectively. (1985PO10) calculate [in a (0 + 1) $\hbar\omega$ model space] that the first four states of ¹⁵Li at 0, 0.73, 2.39 and 2.77 MeV have, respectively, $J^\pi = \frac{3}{2}^-, \frac{1}{2}^-, \frac{7}{2}^-$ and $\frac{5}{2}^-$. See also (1988POZS; theor.).

¹⁵Be
(Not illustrated)

¹⁵Be has not been observed. The calculated mass excess is 51.18 MeV: see (1981AJ01). ¹⁵Be is then unstable with respect to ¹⁴Be+n and ¹³Be+2n by 3.4 and 0.04 MeV, respectively. (1985PO10) calculate [in a (0 + 1) $\hbar\omega$ model space] that the first four states of ¹⁵Be at 0, 0.07, 2.32, 3.10 MeV have, respectively, $J^\pi = \frac{5}{2}^+, \frac{3}{2}^+, \frac{9}{2}^+, \frac{7}{2}^+$. See also (1987SA15; theor.).

¹⁵B
(Figs. 1 and 4)

Mass of ¹⁵B: Wapstra adopts 28970 ± 22 keV (1988WA18, and private communication) and so do we: see (1986AJ01). ¹⁵B is then stable with respect to ¹⁴B + n by 2.77 MeV.

Decay of ¹⁵B: ¹⁵B decays by β^- emission to ¹⁵C: Q_{β^-} (max) = 19.10 MeV. The character of the decay is not known but measurements of the half-life are 11 ± 1 ms (1984DU15), 8.8 ± 0.6 ms (1986CU01), 10.4 ± 0.3 ms (1988MU08), 10.8 ± 0.5 ms (1988SA04), $10.3_{-0.5}^{+0.6}$ ms (1989LE16). The weighted mean of these five values is 10.3 ± 0.2 ms. Omitting the low value from (1986CU01) gives 10.5 ± 0.3 ms, which we adopt.

Upper limits have been set on the P_{0n} and P_{2n} : 5% and 1.5%, respectively (1984DU15). See also (1989LE16).

General: (1985PO10) calculate [in a (0 + 1) $\hbar\omega$ model space] that the first four states of ¹⁵B at 0, 1.53, 2.06, 2.71 MeV have, respectively, $J^\pi = \frac{3}{2}^-, \frac{5}{2}^-, \frac{1}{2}^-$ and $\frac{7}{2}^-$.

Interaction cross sections at 790 MeV/A of ¹⁵B ions with Be, C and Al are reported by (1988TA10). The interaction radius and the r.m.s. radius for the nucleon distributions in ¹⁵B have also been derived (1988TA10). See also (1989SA10), (1986DU11, 1989DE52), (1986GU1D, 1988BAYZ, 1988MI1G, 1990LO10) and (1986AN07, 1989DO1K, 1989PO1K, 1989SI26, 1990RE04; theor.).

¹⁵C
(Figs. 1 and 4)

GENERAL (See also (1986AJ01)).

Model calculations: (1988MI1J, 1989PO1K, 1989WO1E).

Electromagnetic transitions: (1984VA06).

Astrophysical questions: (1989KA1K).

Complex reactions involving ¹⁵C: (1985PO11, 1986AV1B, 1986BI1A, 1986DU11, 1986HA1P, 1986HA1B, 1986PO06, 1987RI03, 1987SA25, 1987SN01, 1987VI02, 1988CA06, 1988JO1B, 1988MI28, 1988RU01, 1988SA19, 1989AS1B, 1989OG1B, 1989SA10, 1989SI26, 1989YO02).

Hypernuclei: (1988MA1G, 1989TA17).

Other topics: (1985AN28, 1986AN07).

Ground state of ¹⁵C: (1985AN28, 1986AS1B, 1987SA15, 1987VA26, 1988VA03, 1989SA10, 1989WO1E).

$$|g| = 2.63 \pm 0.14 \text{ (1988ASZY; prelim.)}$$

$$\mu_{\text{g.s.}} = 1.315 \pm 0.07 \text{ nm (1989RA17)}$$

$$\mu_{0.74} = -1.758 \pm 0.03 \text{ nm (1989RA17)}$$

1. ¹⁵C(β^-)¹⁵N $Q_m = 9.7717$

The half-life of ¹⁵C is 2.449 ± 0.005 s (1979AL23). Transitions have been observed to ¹⁵N_{g.s.} and to the upper of the 5.3 MeV states in ¹⁵N which has $J^\pi = \frac{1}{2}^+$. The $\log f^t$ to ¹⁵N*(5.30) indicates an allowed transition: therefore J^π (¹⁵C_{g.s.}) = $\frac{1}{2}^+$ or $\frac{3}{2}^+$. Weak transitions are observed to ¹⁵N*(7.30, 8.31, 8.57, 9.05) (1979AL23): see Table 15.14. The shape of the ¹⁵C_{g.s.} \rightarrow ¹⁵N_{g.s.} transition differs appreciably from an allowed shape (1984WA07). See also (1986AS1B, 1988ASZY), (1988WA1E) and (1989BA92, 1989PO1K; theor.).

2. ⁹Be(⁷Li, p)¹⁵C $Q_m = 9.092$

Observed proton groups are displayed in Table 15.2.

3. ¹³C(t, p)¹⁵C $Q_m = 0.9127$

Observed groups are displayed in Table 15.3. See also (1981AJ01).

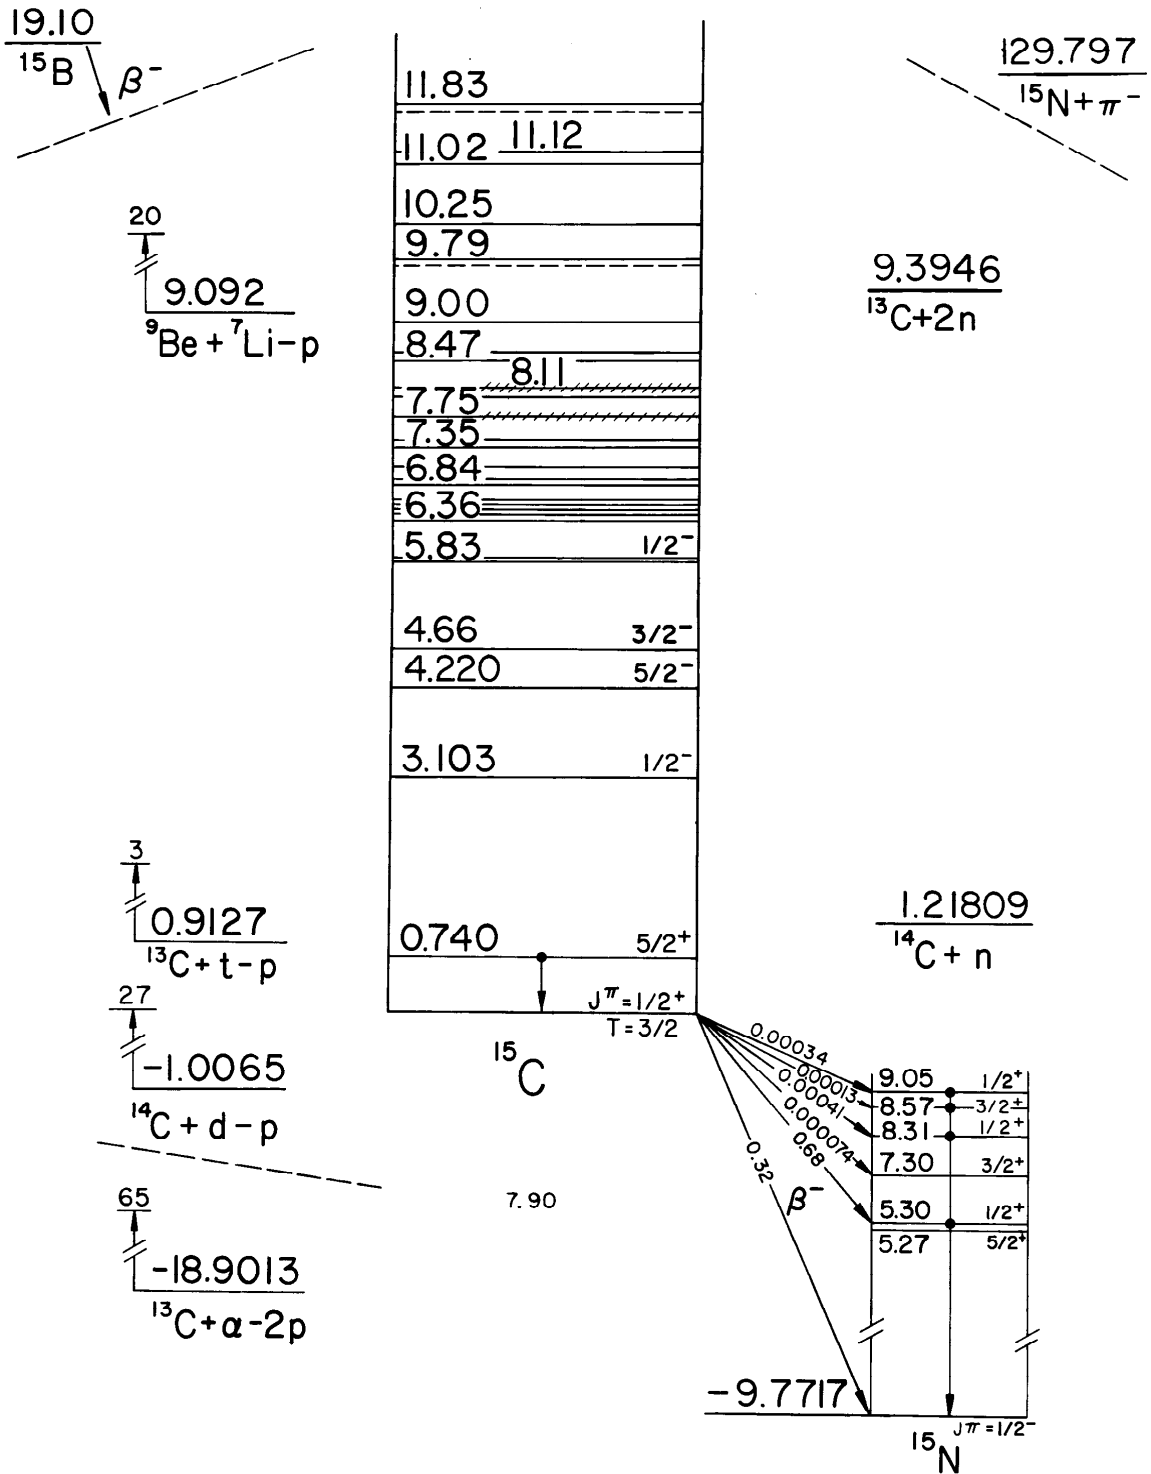

Fig. 1: Energy levels of ^{15}C . For notation see Fig. 2.

(11680 ± 30)					
11825 ± 20	70 ± 30	$(\frac{13}{2} \rightarrow \frac{31}{2})$			

^a For references see Table 15.2 in (1981AJ01).

^b $E({}^7\text{Li}) = 20$ MeV. E_x based on 740 keV for the first excited state.

^c $E_d = 12 - 14$ MeV.

^d Suggested J^π assignments based on angular distributions (and $2J_f + 1$ dependence) and l_{max} from Γ_n .

^e Analysis of the two bound states is done using DWUCK. For the unbound states DOXY was used.

^f $E_x = 739 \pm 1$ keV [from E_γ]; $\tau_m = 3.77 \pm 0.11$ ns.

^g Broad or unresolved states.

^h $\theta_n^2 = 0.0075 \pm 0.0015$.

ⁱ Sum of the J for these two states is 2 [based on $(2J_f + 1)$ dependence of cross section].

^j $\tau_m = 3.73 \pm 0.23$ ns.

^k See also (1985DA23).

^l See text, reaction 6 (1985DA23).

^m Observed but E_x not determined.

ⁿ Observed at $E_d = 27$ MeV.

^o $S = 0.88$.

^p $S = 0.69$ or 0.55 . $g = -0.77 \pm 0.06$.

^q May be unresolved.

4. ${}^{13}\text{C}(\alpha, 2\text{p}){}^{15}\text{C}$

$$Q_m = -18.9013$$

See (1981AJ01).

$$5. \ ^{14}\text{C}(n, \gamma)^{15}\text{C} \quad Q_m = 1.2181$$

$$\sigma_\gamma < 1 \mu\text{b} \text{ (1981MUZQ)}.$$

$$6. \ ^{14}\text{C}(d, p)^{15}\text{C} \quad Q_m = -1.0065$$

At $E_d = 16$ MeV angular distributions and A_y measurements are reported to a state at $E_x = 4.78 \pm 0.10$ MeV ($\Gamma_{\text{c.m.}} = 1.74 \pm 0.40$ MeV); $S = 0.5$. A narrow state at $E_x = 5.81 \pm 0.02$ MeV ($\Gamma_{\text{c.m.}} = 64.3 \pm 8.1$ keV), $S = 0.02$, is also observed. It is suggested that these are 1p2h and 3p4h $\frac{3}{2}^+$ states (1985DA23) [and S.E. Darden, private communication]. For the earlier work see Table 15.2.

Table 15.3: Proton groups from $^{13}\text{C}(t, p)^{15}\text{C}$ ^a

E_x (MeV \pm keV)	J^π	E_x (MeV \pm keV)	J^π
0	$\frac{1}{2}^+$	6.440 ± 6	
0.743 ± 9 ^b	$\frac{5}{2}^+$	6.529 ± 6	
3.100 ± 6 ^b	$\frac{1}{2}^-$	6.622 ± 9	
4.215 ± 9 ^b	$\frac{5}{2}^-$	6.835 ± 6 ^b	$(\frac{7}{2}, \frac{9}{2})^-$
4.657 ± 9 ^b	$\frac{3}{2}^-$	6.876 ± 7	
5.867 ± 8	$\frac{1}{2}^-$	7.093 ± 6	
6.356 ± 6		7.387 ± 7 ^b	$(\frac{9}{2}, \frac{7}{2})^-$
6.404 ± 7			

^a (1983TR12); $E_t = 18$ MeV; DWBA.

^b Strong group.

$$7. \ ^{14}\text{C}(^{13}\text{C}, ^{12}\text{C})^{15}\text{C} \quad Q_m = -3.7283$$

Angular distributions have been studied at $E(^{13}\text{C}) = 20.0$ to 27.5 MeV to $^{15}\text{C}^*(0, 0.74)$ (1988BI11). See also (1990VO1E).

8. $^{15}\text{N}(\pi^-, \gamma)^{15}\text{C}$ $Q_m = 129.797$

Radiative pion capture shows evidence for $J^\pi = \frac{5}{2}^+$, $T = \frac{3}{2}$ giant magnetic quadrupole states: transitions are reported to $^{15}\text{C}^*(0.74)$ as well as to $^{15}\text{C}^*(6.7, 8.6, 12.0)$ (1983ST04).

9. $^{16}\text{O}(^7\text{Li}, ^8\text{B})^{15}\text{C}$ $Q_m = -22.624$

At $E(^7\text{Li}) = 82 \text{ MeV}$ $^{15}\text{C}^*(0, 3.1)$ are populated (1985AL1G).

^{15}N
(Figs. 2 and 4)

GENERAL (See also (1986AJ01)).

Nuclear models: (1985KW02, 1985PH01, 1987KA09, 1987KI1C, 1987ME1D, 1987ST05, 1988WO04, 1989WO1E, 1990VA01)

Special states: (1985AR1H, 1985GO1A, 1985PH01, 1985SH24, 1987KI1C, 1987ST05, 1988KW02, 1988ZH1B, 1989OR02)

Electromagnetic transitions and giant resonances: (1985BL20, 1985GO1A, 1986ER1A, 1987KI1C, 1987ST05, 1989ASZZ)

Astrophysical questions: (1982BU1A, 1982CA1A, 1982WO1A, 1985PR1D, 1986FR1G, 1987AR1C, 1987AU1A, 1987LE1J, 1987ZI1C, 1988FE1A, 1988KR1G, 1988PI1C, 1988WA1I, 1989CH1X, 1989GU1Q, 1989GU1J, 1989GU1L, 1989JI1A, 1989KA1K, 1989KE1D, 1989ME1C, 1989NO1A, 1989WY1A, 1989YO1H, 1990HA1W, 1990RA1O)

\approx 37			γ , p	28

^a See also Tables 15.5 and 15.12 here, and Table 15.6 in (1986AJ01) [τ_m].

^b Revisions in the values of the fundamental constants and of the binding energy of the deuteron, as well as a reevaluation of earlier work, lead (1990WA22) to suggest values for E_x which differ from the ones shown by, typically, 40 eV [lower].

^c See also reaction 40.

^d Wide or unresolved.

$$\langle r^2 \rangle^{1/2} = 2.612 \pm 0.009 \text{ fm (1988DE09)}$$

$$\mu = -0.283188842 (45) \text{ nm (see 1989RA17)}$$

Natural abundance: $(0.366 \pm 0.009)\%$ (1984DE53)

$^{15}\text{N}^*(5.27)$: $\mu = +(2.35 \pm 0.18) \text{ nm (see 1989RA17)}$

1. (a) $^9\text{Be}(^6\text{Li}, \text{n})^{14}\text{N}$	$Q_m = 14.4986$	$E_b = 25.3319$
(b) $^9\text{Be}(^6\text{Li}, \text{p})^{14}\text{C}$	$Q_m = 15.1245$	
(c) $^9\text{Be}(^6\text{Li}, \text{t})^{12}\text{C}$	$Q_m = 10.4835$	
(d) $^9\text{Be}(^6\text{Li}, \alpha)^{11}\text{B}$	$Q_m = 14.3403$	

Thick target neutron yields are reported at $E(^6\text{Li}) = 40 \text{ MeV}$ (1987SC11). The yield of p_0 and p_1 (reaction (b)) for $E(^6\text{Li}) = 3.84$ to 6.40 MeV shows some broad structure: analysis in terms of Ericson fluctuation theory gives a value of $\approx 0.4 \text{ MeV}$ for the average level width at $E_x = 28 \text{ MeV}$ in ^{15}N . The excitation functions for t_0 (reaction (c)), α_0 , α_1 and α_2 (reaction (d)) show broad structures for $E(^6\text{Li}) = 4$ to 14 MeV . See (1976AJ04) for the references.

2. $^9\text{Be}(^7\text{Li}, \text{n})^{15}\text{N}$	$Q_m = 18.0818$
--	-----------------

Fig. 2: Energy levels of ^{15}N . In these diagrams, energy values are plotted vertically in MeV, based on the ground state as zero. Uncertain levels or transitions are indicated by dashed lines; levels which are known to be particularly broad are cross-hatched. Values of total angular momentum J , parity, and isobaric spin T which appear to be reasonably well established are indicated on the levels; less certain assignments are enclosed in parentheses. For reactions in which ^{15}N is the compound nucleus, some typical thin-target excitation functions are shown schematically, with the yield plotted horizontally and the bombarding energy vertically. Bombarding energies are indicated in laboratory coordinates and plotted to scale in cm coordinates. Excited states of the residual nuclei involved in these reactions have generally not been shown; where transitions to such excited states are known to occur, a brace is sometimes used to suggest reference to another diagram. For reactions in which the present nucleus occurs as a residual product, excitation functions have not been shown; a vertical arrow with a number indicating some bombarding energy, usually the highest, at which the reaction has been studied, is used instead. Further information on the levels illustrated, including a listing of the reactions in which each has been observed, is contained in the master table, entitled “Energy levels of ^{15}N ”.

Table 15.5: Radiative decays in $^{15}\text{N}^a$

E_i (MeV)	J_i^π	E_f (MeV)	J_f^π	Branch (%)	Mult. mixing ratio δ

^a See also Tables 15.12 and 15.15, and 15.6 in (1986AJ01). For references see Table 15.4 in (1981AJ01). Please note that (1976BE1B) is an unpublished Ph.D. thesis.

^b Transitions to $^{15}\text{N}^*(5.27, 5.30)$ are < 0.1 and $< 0.05\%$, respectively (1975MO28).

^c Transitions to $^{15}\text{N}^*(0, 5.30, 6.32)$ are < 0.1 , < 4 and $< 0.5\%$.

^d Transitions to $^{15}\text{N}^*(5.30, 6.32)$ are < 4 and $< 0.6\%$.

^e Transitions to $^{15}\text{N}^*(5.30, 7.30, 7.57)$ are < 12 , < 0.7 and $< 3\%$.

^f Transitions to $^{15}\text{N}^*(7.16, 7.57, 8.31)$ are < 10 , < 2 and $< 0.5\%$.

^g Transitions to $^{15}\text{N}^*(7.16, 7.57, 8.31)$ are < 1 , < 20 and $< 5\%$.

^h Transitions to $^{15}\text{N}^*(7.30, 8.31, 8.57)$ are < 2 , < 1 and $< 2\%$.

ⁱ Transitions to $^{15}\text{N}^*(0, 5.30)$ are < 4 and $< 15\%$.

^j Transitions to $^{15}\text{N}^*(7.16, 7.57, 8.31, 8.57)$ are each $< 1\%$.

^k For upper limits for transitions to other states see Table 15.4 in (1981AJ01).

^l Transitions to $^{15}\text{N}^*(0, 5.30, 9.83)$ are < 12 , < 2 and $< 0.1\%$. See also (1990GO25).

^m See also (1990GO25).

ⁿ π is + because if π were - the Γ_γ and δ of the $10.80 \rightarrow 5.30$ MeV transition would lead to an unacceptably high M2 value (33 W.u.) (P.M. Endt, private communication). See also (1990GO25).

^o See footnote ^g in Table 15.4 (1981AJ01).

^p $\Gamma_{\gamma_0} = 3.0 \pm 0.9$ eV, $\Gamma_p \Gamma_{\gamma_0} / \Gamma = 1.70 \pm 0.5$ eV; $\delta = 0.00 \pm 0.04$ (M2/E1); $B(E1) = (1.2 \pm 0.4) 10^{-3} e^2 \cdot \text{fm}^2$. Transitions to $^{15}\text{N}^*(5.27, 5.30)$ are $< 8\%$ and to $^{15}\text{N}^*(6.32, 7.16, 7.30)$ are $< 5\%$.

See (1985MC1C; applied).

$$3. \ ^9\text{Be}(^{12}\text{C}, \ ^6\text{Li})^{15}\text{N} \quad Q_m = -2.8395$$

See (1988GO1H; $E(^{12}\text{C}) = 65$ MeV; prelim.).

$$4. \ ^{10}\text{B}(^6\text{Li}, \text{p})^{15}\text{N} \quad Q_m = 18.7462$$

Table 15.6: Resonances in $^{11}\text{B}(\alpha, \gamma_0)^{15}\text{N}$ ^a

E_α (MeV)	E_x (MeV)	$\Gamma_{\text{c.m.}}$ (keV)	Γ_γ (eV)	J^π
7.20	16.27 ± 0.04	240 ± 30	≥ 11	$\frac{3}{2}^+$
7.70	16.64 ± 0.04	250 ± 30	≥ 11	$\frac{1}{2}^+$
8.40 ^b	17.15 ± 0.05	250 ± 60	≥ 2	$(\frac{1}{2}^+, \frac{3}{2}^+)$
9.11 ^b	17.67 ± 0.05	600 ± 80	≥ 7	$\frac{3}{2}^+$
10.80 ^c	18.91 ± 0.15	750 ± 70		$\frac{3}{2}^+ + \frac{1}{2}^+$
14.00 ^c	21.25 ± 0.15	1740 ± 150		$\frac{3}{2}^+ + \frac{1}{2}^+$

^aFor references and other information see Table 15.7 in (1986AJ01).

^b These E_α may be 100 keV too high.

^c There is indication of M1/E2 transitions interfering with the predominant E1 transitions.

At $E(^6\text{Li}) = 4.9$ MeV, thirty proton groups are observed corresponding to ^{15}N states with $E_x < 16.8$ MeV. Angular distributions have been measured for the proton groups corresponding to $^{15}\text{N}^*(5.27 + 5.30, 6.32, 7.16 + 7.30, 7.57, 8.31, 8.57, 9.05 + 9.15)$: see (1976AJ04).

5. $^{10}\text{B}(^7\text{Li}, \text{d})^{15}\text{N}$ $Q_m = 13.7207$

At $E(^7\text{Li}) = 24$ MeV angular distributions have been studied to many of the ^{15}N states with $E_x < 15.5$ MeV: see (1981AJ01).

6. $^{11}\text{B}(\alpha, \gamma)^{15}\text{N}$ $Q_m = 10.9916$

The 90° differential cross section for γ_0 production has been measured for $E_\alpha = 5.74$ to 18.0 MeV: see (1981AJ01, 1986AJ01). For the observed resonances see Table 15.6. See also (1988WAZY; prelim.).

7. (a) $^{11}\text{B}(\alpha, \text{n})^{14}\text{N}$ $Q_m = 0.1583$ $E_b = 10.9916$
 (b) $^{11}\text{B}(\alpha, \text{p})^{14}\text{C}$ $Q_m = 0.7842$

Reported resonances are displayed in Table 15.7. Nine resonances have been observed in the total cross section for reaction (a) in the range $E_\alpha = 0.55$ to 2.40 MeV (1988WAZY; prelim.)

[astrophysical reaction rates will be derived]. For thick target neutron yields for $E_\alpha = 1.0$ to 9.8 MeV, see the review in (1989HE04). See also (1987EL1B; applied).

The total cross section for reaction (b) has been measured for $E_\alpha = 0.9$ to 1.7 MeV: resonance information is deduced by (1987TU01). At higher energies (to 25 MeV) the p_0 excitation functions show broad features: see (1981AJ01).

Table 15.7: Resonances in $^{11}\text{B} + \alpha$ ^a

^a For references see Table 15.7 in (1981AJ01).

^b (1988WAZY; prelim.): $\Gamma < 0.2$ keV.

^c (1987TU01); $J^\pi = \frac{3}{2}^{(-)}, \frac{3}{2}^{-}, \frac{1}{2}^{-}, \frac{5}{2}^{+}, \frac{3}{2}^{-}$ [see also for partial widths].

8. (a) $^{11}\text{B}(\alpha, \text{d})^{13}\text{C}$

$$Q_{\text{m}} = -5.1677$$

$$E_{\text{b}} = 10.9916$$

(b) $^{11}\text{B}(\alpha, \text{t})^{12}\text{C}$

$$Q_{\text{m}} = -3.8568$$

The yield of d_0 has been measured for $E_\alpha = 13.5$ to 25 MeV. The excitation functions for t_0 and t_1 (to 25 MeV) show strong uncorrelated structures: see (1976AJ04, 1981AJ01). See also (1989VA07).

Observed resonances are shown in Table 15.7.

At $E(^6\text{Li}) = 34$ MeV angular distributions are reported to the states with $5.3 < E_x < 16.3$ MeV: this reaction appears to be less selective than reaction 11. The most strongly populated states are $^{15}\text{N}^*(9.2, 10.5, 10.7, 13.1, 14.8, 15.5)$. See (1981AJ01). See also (1990AZZZ).

At $E(^7\text{Li}) = 24$ and 34 MeV, angular distributions to states with $5.3 < E_x < 15.6$ MeV have been measured: $^{15}\text{N}^*(9.8, 10.5, 10.7, 15.4, 15.5)$ are particularly strongly populated at 34 MeV. $J^\pi = \frac{9}{2}^+, \frac{9}{2}, \frac{11}{2}, \frac{9}{2}, \frac{11}{2}, \frac{13}{2}, \frac{15}{2}$ are suggested for $^{15}\text{N}^*(10.69, 12.56, 13.03, 13.19, 13.84, 14.11, 15.37)$. Only $^{15}\text{N}^*(15.52)$ appears to have a large cluster component corresponding to $^{11}\text{B} + \alpha$. See (1981AJ01). For a study of the γ -decay, see (1981AJ01). At $E(^7\text{Li}) = 34, 40, 45$ and 55 MeV states at $E_x = 13.88, 17.10, 18.67, 18.81, 19.70, 19.93$ and 22.86 MeV are reported to be strongly populated (1990AZZZ; prelim.). See also (1990DA03).

Gamma-ray cross sections involving $^{15}\text{N}^*(5.3, 6.32, 7.16, 7.30, 7.57, 8.57)$ are reported at $E_{c.m.} = 1.92, 2.30$ and 2.46 MeV (1986CU02). See (1984DA17) for cross sections and S -factors.

Angular distributions have been measured at $E(^{16}\text{O}) = 27$ to 60 MeV involving the two proton-hole states of ^{15}N [$^{15}\text{N}^*(0, 6.32)$; $J^\pi = \frac{1}{2}^-, \frac{3}{2}^-$] and $^{12}\text{C}^*(0, 4.4, 9.6)$: see (1976AJ04). See also (1989KA1N; theor.).

14. (a) $^{12}\text{C}(t, \gamma)^{15}\text{N}$	$Q_m = 14.8484$	
(b) $^{12}\text{C}(t, n)^{14}\text{N}$	$Q_m = 4.0151$	$E_b = 14.8484$
(c) $^{12}\text{C}(t, p)^{14}\text{C}$	$Q_m = 4.6410$	
(d) $^{12}\text{C}(t, t)^{12}\text{C}$		
(e) $^{12}\text{C}(t, \alpha)^{11}\text{B}$	$Q_m = 3.8568$	

The 90° excitation function for γ_0 in the range 1.0 to 6.5 MeV [see (1981AJ01, 1986AJ01)] shows one very strong resonance (at peak, $4.4 \pm 0.5 \mu\text{b/sr}$) corresponding to $^{15}\text{N}^*(16.7)$ as well as two other strong (unresolved and/or broad) resonances at $E_t \approx 3.3$ and 6 MeV: Table 15.8 shows the derived parameters. Table 15.8 also displays the structures observed in reactions (b)→(e). At $E_t = 17$ MeV the polarization and analyzing power for the transition to $^{14}\text{C}_{\text{g.s.}}$ (reaction (c)) are shown to be the same, as required by the conservation of parity. The VAP for the elastic scattering (reaction (d)) has been measured at $E_t = 9$ and 11 MeV: see (1985AJ01). See (1981AJ01) for the earlier work. See also (1985SA31, 1990HA46; theor.).

15. $^{12}\text{C}(^3\text{He}, \pi^+)^{15}\text{N}$ $Q_m = -124.7387$

Individual states have not been resolved in this reaction. The cross section over the bound states of ^{15}N is < 0.03 nb at $E_{\pi^+} = 5$ MeV and 0.8 ± 0.2 nb at $E_{\pi^+} \approx 60$ MeV [$E(^3\text{He}) = 170.2$ and 236.3 MeV, respectively] (1988HO15). For the earlier work see (1984BI08, 1986SC23).

16. $^{12}\text{C}(\alpha, p)^{15}\text{N}$ $Q_m = -4.9656$

Angular distributions have been measured at many energies for $E_\alpha = 13.4$ to 96.8 MeV: see (1976AJ04, 1981AJ01, 1986AJ01). See also (1987MIZY, 1988BRZY; $E_\alpha = 48$ MeV; prelim.), (1987BI1C; $E_\alpha = 218$ MeV; prelim.) and (1989BR1J).

17. $^{12}\text{C}(^6\text{Li}, ^3\text{He})^{15}\text{N}$ $Q_m = -0.9471$

Observed ^3He groups are displayed in Table 15.9 of (1981AJ01). Comparisons of the angular distributions obtained in this reaction at $E(^6\text{Li}) = 60.1$ MeV and in the $(^6\text{Li}, t)$ reaction shows analog correspondence for the following pairs of levels: 5.27 – 5.24, 7.16 – 6.86, 7.57 – 7.28, 8.57 – 8.28, 10.80 – 10.48, 13.15(u) – 12.84, 15.49(u) – 15.05 [first listed is E_x in ^{15}N -second in ^{15}O]. [E_x are nominal; u = unresolved.] For γ -decay measurements see Table 15.5. See also (1990AZZZ).

^a $E(^7\text{Li}) = 35$ MeV; angular distributions have been measured for the states labelled by this footnote; $E_x \pm 10$ keV.

^b $E(^7\text{Li}) = 48$ MeV; angular distributions have been measured for the states labelled by this footnote; $E_x \pm 20$ keV unless otherwise shown.

^c (1973TS02) suggest that this state is not the $T = \frac{3}{2}$ state at 12.52 MeV.

^d Wide or unresolved.

18. $^{12}\text{C}(^7\text{Li}, \alpha)^{15}\text{N}$

$$Q_m = 12.3806$$

Observed α -groups are shown in Table 15.9. Angular distributions have been measured to $E(^7\text{Li}) = 48$ MeV. Comparison of spectra from this reaction ($E(^7\text{Li}) = 34.9$ MeV) with those from $^{13}\text{C}(^6\text{Li}, \alpha)$ (reaction 26) lead to configurations of (d)³ for $^{15}\text{N}^*(10.7, 12.57, 13.20, 15.42)$ and suggest that $^{15}\text{N}^*(12.57, 13.20)$ have lower J than $^{15}\text{N}^*(10.7, 15.5)$, probably $J \leq \frac{7}{2}$. $^{15}\text{N}^*(13.02)$ is shown to be p(d)² in agreement with $J^\pi = \frac{11}{2}^-$: see (1981AJ01).

$^{15}\text{N}^*(9.155)$ [$J = \frac{5}{2}$] decays to $^{15}\text{N}^*(5.30)$ [$J = \frac{1}{2}^+$] by an E2 transition; therefore its parity is positive. It has a large triton cluster parentage. This is not true of $^{15}\text{N}^*(9.152)$: see (1981AJ01). For γ -decay measurements see Table 15.5. See also (1985SA31; theor.).

19. (a) $^{12}\text{C}(^{11}\text{B}, ^8\text{Be})^{15}\text{N}$ $Q_m = 3.6250$
 (b) $^{12}\text{C}(^{13}\text{C}, ^{10}\text{B})^{15}\text{N}$ $Q_m = -9.0275$
 (c) $^{12}\text{C}(^{18}\text{O}, ^{11}\text{B}\alpha)^{15}\text{N}$ $Q_m = -11.9768$

For reaction (a) see (1981AJ01) and (1988MA07). For reaction (b) see (1989VO1D). For reaction (c) see (1984RA07).

20. $^{13}\text{C}(\text{d}, \gamma)^{15}\text{N}$ $Q_m = 16.1594$

The $90^\circ - 95^\circ$ yields of γ_0 have been measured for $E_d = 1$ to 10 MeV: observed resonances are displayed in Table 15.10. The γ -ray angular distributions are consistent with the emission of predominantly E1 radiation except for evidence of M1/E2 transitions in the region $E_x = 20 - 21.5$ MeV: see (1981AJ01). See also (1990HA46).

21. (a) $^{13}\text{C}(\text{d}, \text{n})^{14}\text{N}$ $Q_m = 5.3260$ $E_b = 16.1594$
 (b) $^{13}\text{C}(\text{d}, \text{p})^{14}\text{C}$ $Q_m = 5.9519$
 (c) $^{13}\text{C}(\text{d}, 2\text{p})^{13}\text{B}$ $Q_m = -14.880$

Observed resonances are displayed in Table 15.10. Polarization measurements have been carried out at $E_d = 12.3$ MeV (reaction (a)) and 13 and 56 MeV (reaction (b)): see (1986AJ01). See also (1987AB04). For VAP measurements (reaction (c)) at $E_d = 70$ MeV to $^{13}\text{B}_{\text{g.s.}}$ see (1986MO27).

22. $^{13}\text{C}(\text{d}, \text{d})^{13}\text{C}$ $E_b = 16.1594$

Excitation functions for elastically scattered deuterons have been measured in the range $E_d = 0.4$ to 5.7 MeV: see (1976AJ04). Polarization studies have been reported for $E_d = 12.5$ to 15 MeV and at $E_d = 56$ MeV: see (1981AJ01, 1986AJ01).

23. (a) $^{13}\text{C}(\text{d}, \text{t})^{12}\text{C}$ $Q_m = 1.3109$ $E_b = 16.1594$
 (b) $^{13}\text{C}(\text{d}, ^3\text{He})^{12}\text{B}$ $Q_m = -12.040$
 (c) $^{13}\text{C}(\text{d}, \alpha)^{11}\text{B}$ $Q_m = 5.1677$

Observed resonances are listed in Table 15.10. For polarization measurements to $E_d = 29$ MeV [reactions (a), (b)] see (1981AJ01).

Table 15.10: Resonances in $^{12}\text{C} + \text{d}$ ^a

6.65	γ_0	≈ 700	21.92
8.8	γ_0	broad	23.8

^a See references listed in Tables 15.10 (1976AJ04, 1981AJ01).

^b $J^\pi = \frac{1}{2}^-$ or $\frac{3}{2}^+$; $T = \frac{1}{2}$.

$$24. \ ^{13}\text{C}(^3\text{He}, \text{p})^{15}\text{N} \quad Q_m = 10.6658$$

Observed proton groups and γ -rays are listed in Table 15.11 of (1981AJ01). Angular distributions have been reported for $E(^3\text{He}) = 4.37$ to 20 MeV: see (1981AJ01).

$$25. \ ^{13}\text{C}(\alpha, \text{d})^{15}\text{N} \quad Q_m = -7.6874$$

At $E_\alpha = 34.9$ MeV a ZRDWBA analysis has been made of the angular distributions to $^{15}\text{N}^*(5.27, 5.30, 7.16, 7.30, 7.56, 8.31, 8.57, 9.05, 9.15, 10.07, 10.53, 10.69, 11.43, 11.94, 12.10, 12.33, 12.49, 12.56, 13.00, 13.83, 14.08)$. $L = 0$ for the group(s) to $^{15}\text{N}^*(9.15, 10.69)$; $L = 2$ for $^{15}\text{N}^*(12.56)$; $L = 3$ for $^{15}\text{N}^*(5.27, 7.16, 7.56)$; $L = 4$ for $^{15}\text{N}^*(11.94, 13.00)$; $L = 1$ for the remaining transitions (1984YA03). See also Table 15.11 of (1976AJ04).

26. $^{13}\text{C}(^6\text{Li}, \alpha)^{15}\text{N}$ $Q_m = 14.6843$

Angular distributions have been measured at $E(^6\text{Li}) = 32$ MeV to $^{15}\text{N}^*(0, 5.30, 6.32, 7.16, 7.30, 7.57, 8.31, 8.57, 9.15, 9.23, 9.83, 10.07, 10.70, 11.94, 13.00)$: the results are consistent with the previously known J^π , with (odd) parity for $^{15}\text{N}^*(9.83)$ and with $J^\pi = \frac{9}{2}^-$ for $^{15}\text{N}^*(11.94)$: see (1981AJ01).

27. (a) $^{13}\text{C}(^{10}\text{B}, ^8\text{Be})^{15}\text{N}$ $Q_m = 10.1328$

(b) $^{13}\text{C}(^{11}\text{B}, ^9\text{Be})^{15}\text{N}$ $Q_m = 0.3440$

For reaction (a) see (1988MA07). For reaction (b) see (1981AJ01).

28. $^{14}\text{C}(\text{p}, \gamma)^{15}\text{N}$ $Q_m = 10.2074$

Observed resonances are displayed in Table 15.11; the branching ratios are shown in Table 15.5. Narrow anomalies (in the γ_0 yield for $E_p = 2.8$ to 30 MeV) are reported at $E_p = 10.0, 11.0, 12.35, 13.6, 16.4$ MeV. A good fit to the total cross section ($E_{\bar{p}} = 7.5$ to 19 MeV) is obtained with the GDR split into peaks at $E_x = 21.0$ and 25.5 MeV with $\Gamma = 6$ and 2 MeV, respectively. The integrated E2 cross section for $E_x = 19.5$ to 27.0 MeV is $(6.8 \pm 1.4)\%$ of the isoscalar sum rule. The reaction thus shows no sign of a collective E2 resonance in that E_x region. [Another study shows no appreciable E2 strength concentration for $E_x = 14.3$ to 23.3 MeV.] Above the GDR region the 90° γ_0 cross section decreases smoothly with energy except for a small peak which would correspond to $^{15}\text{N}^*(37.0)$. See (1981AJ01, 1986AJ01) for the references. See also (1985CA41, 1988CA26, 1990GO25; astrophysics) and (1990HA46; theor.).

29. $^{14}\text{C}(\text{p}, \text{n})^{14}\text{N}$ $Q_m = -0.6259$ $E_b = 10.2074$

Observed resonances are displayed in Table 15.11. Cross sections have recently been measured for $E_p = 0.67$ to 1.20 MeV (1989KEZZ; prelim.). Polarization measurements are reported at $E_{\bar{p}} = 160$ MeV (1984TA07, 1987RA15; A_y ; $D_{\text{NN}}(0^\circ)$; n to $^{14}\text{N}^*(0, 2.31, 3.95, 13.72)$). Forward-angle differential cross sections have been measured at $E_p = 200, 300, (400), 450$ MeV (1986AL18, 1989AL04; $n_1 + n_2$) and at 492 MeV (1989RA09; n_1, n_2). See (1986AJ01) for the earlier work. See also (1985TA23), (1986TA1E, 1987TA22, 1989SU1J), (1985CA41, 1988CA26; astrophysics) and (1987BE1D, 1987LO1D; theor.).

30. (a) $^{14}\text{C}(\text{p}, \text{p})^{14}\text{C}$ $E_b = 10.2074$

(b) $^{14}\text{C}(\text{p}, \alpha)^{11}\text{B}$ $Q_m = -0.7842$

r = resonant

n.r. = non-resonant

^a See Tables 15.5 in (1959AJ76), 15.11 in (1970AJ04) and 15.12 in (1981AJ01) for references and additional comments.

^b ω_{γ} .

^c Γ_{γ_0} . I am indebted to P.M. Endt for this correction.

^d E_{x} measured directly: see (1981AJ01).

^e Analog not observed in $^{14}\text{N}(\text{p}, \gamma)^{15}\text{O}$.

^f Resonances are observed at $E_{\text{p}} = 262, 351, 520, 528$ and 635 keV [± 1 keV] (1990GO25). See also Table 15.5. I am indebted to Drs. J. Gorres and M. Wiescher for sending me these results prior to publication.

^g $\omega_{\gamma} = 840 \pm 130$ meV (1990GO25).

^h $\omega_{\gamma} = 270 \pm 40$ meV (1990GO25).

Observed resonances and anomalies are displayed in Table 15.11. For polarization measurements see (1981AJ01, 1986AJ01). See also (1989AM01; theor.).

$$31. \ ^{14}\text{C}(\text{d}, \text{n})^{15}\text{N} \quad Q_{\text{m}} = 7.9829$$

Angular distributions have been measured for $E_{\text{d}} = 1.3$ to 6.5 MeV: see (1976AJ04).

$$32. \ ^{14}\text{C}(\text{}^3\text{He}, \text{d})^{15}\text{N} \quad Q_{\text{m}} = 4.7139$$

Angular distributions have been studied at $E(\text{}^3\text{He}) = 23$ MeV to $^{15}\text{N}^*(0, 5.27 + 5.30, 6.32, 7.16, 7.30)$: see (1981AJ01). See also (1976AJ04).

$$33. \ ^{14}\text{C}(\text{}^7\text{Li}, \text{}^6\text{He})^{15}\text{N} \quad Q_{\text{m}} = 0.2328$$

See (1988AL1G); $E(\text{}^7\text{Li}) = 27$ MeV; prelim.).

$$34. \ ^{14}\text{C}(\text{}^{16}\text{O}, \text{}^{15}\text{N})^{15}\text{N} \quad Q_{\text{m}} = -1.9201$$

See (1976AJ04, 1986AJ01).

$$35. \ ^{14}\text{N}(\text{n}, \gamma)^{15}\text{N} \quad Q_{\text{m}} = 10.8333$$

The thermal cross section is 79.8 ± 1.4 mb (1990ISO5). See also (1988MCZT).

Observed γ -rays from thermal neutron capture are displayed in Table 15.12. See also Table 15.5. The $90^\circ \gamma_0$ yield and angular distributions have been measured for $E_{\text{n}} = 5.6$ to 15.3 MeV. The cross section shows two prominent dips at $E_{\text{x}} = 16.7$ and 18.1 MeV [compare with $^{14}\text{N}(\text{p}, \gamma)$; reaction 9 in ^{15}O] and broad structures at $E_{\text{x}} \approx 17$ and 19 MeV. The angular distribution data are consistent with essentially pure E1 radiation in the region $E_{\text{x}} = 17$ to 24 MeV (1982WE01). See also (1989WO1C) and (1989GU1J; astrophys.).

$$36. \ ^{14}\text{N}(\text{n}, \text{n})^{14}\text{N} \quad E_{\text{b}} = 10.8333$$

C = capturing state.

^a See also Tables 15.13 in (1981AJ01, 1986AJ01) for earlier references, comments and reports. The previously reported transition to $^{15}\text{N}^*(9.76)$ has not been confirmed: $I_\gamma < 0.01\%$ (T.J. Kennett, private communication). (1990WA22) [see footnote ^b in Table 15.4] recommends different values for E_γ and E_x .

^b Error in Q_m not included. Adjustments due to it require the addition in quadrature of the Q_m error: see (1986KE14).

^c In units of photons/100 captures (1986KE14): errors are statistical only but these are predominant.

^a (1979AL23).

^b (1976AL16). 5297.794 ± 0.035 keV: see (1981WA06).

^c (1984WA07).

$E_n = 0.14, 1.3$ and 2.1 MeV (1988KO18; σ_t), 7.67 to 13.50 MeV (1986CH2F; el and inel; prelim.). $10.96, 13.96$ and 16.95 MeV (1985TE01; elastic). The $(n, n'\gamma)$ cross section has been measured for $E_n = 2.5$ to 3.5 MeV (1989STZW; prelim.; applied). Analyzing powers for the n_0 group have been measured for $E_n = 10$ to 17 MeV (1989LI26). See also ^{14}N , (1988BA55, 1986LI1M) and (1988MA1H).

37. $^{14}\text{N}(n, 2n)^{13}\text{N}$

$$Q_m = -10.5535$$

$$E_b = 10.8333$$

Cross sections have been measured for $E_n = 10$ to 37 MeV [see (1988MCZT)] and at $E_n = 13.40$ to 14.87 MeV (1989KA1S). See also (1989KA2B).

38. (a) $^{14}\text{N}(n, p)^{14}\text{C}$

$$Q_m = 0.6259$$

$$E_b = 10.8333$$

(b) $^{14}\text{N}(n, d)^{13}\text{C}$

$$Q_m = -5.3260$$

(c) $^{14}\text{N}(n, t)^{12}\text{C}$

$$Q_m = -4.0151$$

(d) $^{14}\text{N}(n, ^3\text{He})^{12}\text{B}$

$$Q_m = -12.7436$$

(e) $^{14}\text{N}(n, \alpha)^{11}\text{B}$

$$Q_m = -0.1583$$

(1989KO11), using the “white” neutron source LANSCE, have measured the (n, p) cross section from 61 meV to 34.6 keV. Their results support the role of this reaction as a “poison” during s-process nucleosynthesis. [See (1989KO11) for a discussion of other measurements.] See

also (1988BR17, 1989KEZZ). For a display of the measured cross sections for (a) and (c), see (1988MCZT). See also (1988SUZY; $E_n = 5.0$ to 10.6 MeV; $\sigma = 11$ to 30 mb; prelim.) for reaction (c) and (1988MA1H). For resonances in reactions (a) and (e), see Table 15.13. (1986SU15) report double-differential cross sections at $E_n = 27.4, 39.7$ and 60.7 MeV for all five reactions. See also (1989CH2E).

$$39. \text{}^{14}\text{N}(p, \pi^+)\text{}^{15}\text{N} \quad Q_m = -129.518$$

At $E_p = 200$ MeV, angular distributions and A_y have been measured for the transitions to $^{15}\text{N}^*(0, 6.32, 8.31)$ as well as for a number of unresolved transitions. A sharp group at $E_x = 21.5$ MeV is suggested to correspond to a $\frac{15}{2}^-$ state (1988AZ1D, 1987AZZZ; Ph.D. thesis and abstract).

$$40. \text{}^{14}\text{N}(d, p)\text{}^{15}\text{N} \quad Q_m = 8.6087$$

Proton groups (and γ -rays) from this reaction are displayed in Table 15.15 of (1981AJ01). The results include $E_x = 7567.1 \pm 1.0$ keV for $^{15}\text{N}^*(7.57)$. Newer values, derived from measurements of proton groups in a spectrograph, are $5270.2 \pm 1.3, 6324.0 \pm 1.0, 7154.85 \pm 0.17, 7300.80 \pm 0.09, 7563.25 \pm 0.19, 8312.79 \pm 0.12, 8571.53 \pm 0.25, 9050.24 \pm 0.33, 10064.34 \pm 0.31$ and 11235.5 ± 0.5 keV (1990PI05). Angular distributions have been measured for $E_d = 0.32$ to 52 MeV and lead to l_n, J^π and spectroscopic factors: see Table 15.15 in (1981AJ01). Branching ratios and multipolarities are shown in Table 15.15. See also (1985LI1H, 1985ME1E, 1987SI1D, 1988LI1E, 1988VI1A, 1989VI1E; applications).

$$41. \text{}^{14}\text{N}(\text{}^{14}\text{N}, \text{}^{13}\text{N})\text{}^{15}\text{N} \quad Q_m = 0.2799$$

See (1981AJ01) and (1988DA12; theor.).

$$42. \text{}^{15}\text{C}(\beta^-)\text{}^{15}\text{N} \quad Q_m = 9.7717$$

See reaction 1 in ^{15}C and Table 15.14.

$$43. \text{(a) } \text{}^{15}\text{N}(\gamma, n)\text{}^{14}\text{N} \quad Q_m = -10.8333$$

^a For references and $B(\lambda)\uparrow$ see Table 15.17 in (1981AJ01). See also Tables 15.5 and 15.6 here. Form factors have also been measured to $^{15}\text{N}^*(9.23, 11.29$ [both $\frac{1}{2}^-$], 10.45 [$\frac{5}{2}^-$], 12.1 [u], 12.9 [u]) (1987DE1Q) [unpublished Ph.D. thesis].

^b (1981MO09): (γ, γ) .

^c See note added in proof in (1975MO28).

^d $\delta(\text{E2/M1}) = 0.137 \pm 0.005$. See, however, Table 15.5.

^e Using $\delta(\text{E2/M1}) = 0.132 \pm 0.004$ [see Table 15.5] $\Gamma_{\gamma_0} = 3.07 \pm 0.18$ eV (M1) and $(5.34 \pm 0.44) \times 10^{-2}$ eV (E2) (D.J. Millener, private communication.)

^f $\delta(\text{E2/M1}) > 0.3$.

^g Mixing ratio is very small [see Table 15.5] and the transition is almost purely M1 (D.J. Millener, private communication).

The total photoneutron cross section from threshold to 38 MeV shows a very broad GDR which extends from ≈ 16 to 30 MeV. Maxima are observed at $E_\gamma \approx 23.5$ and 25.5 MeV ($\sigma \approx 11$ mb): see (1988DI02) [based on (1982JU03; monoenergetic photons)]. However, (1989BA25) report a sharper single peak at $E_\gamma = 25.5$ MeV in the (γ, Sn) reaction with a cross section of ≈ 16 mb. See (1989BA25) for a discussion of the $T_<$ and $T_>$ components of the GDR.

The (γ, n_0) cross section for $E_x = 13$ to 24 MeV shows a broad structure centered at $E_x \approx 14.5$ MeV and a resonance at $E_x = 17.3 \pm 0.1$ MeV. A large fraction of the photoabsorption strength leading to $^{14}\text{N}_{\text{g.s.}}$ is due to the formation of $\frac{3}{2}^+$, $T = \frac{1}{2}$ states in ^{15}N which decay by d-wave emission. The absorption is essentially pure E1 (1983WA03). See also (1981AJ01).

The $(\gamma, 2n)$ reaction has been studied from threshold to 38 MeV [see (1988DI02)] and more recently from 20 to 28 MeV by (1988MC01). The cross section remains near zero for 3 MeV above threshold and then rises sharply at about 24 MeV to a maximum value of 1.7 mb (1988MC01) [see, however, (1982JU03)]. For discussions of the results in terms of the density of $T_>$ states in ^{14}N , see (1988MC01, 1989BA25 (p.511)).

For discussions of the (γ, p) reaction see (1981AJ01) and (1989BA25). The latter show a curve for the total absorption cross section $[(\gamma, n) + (\gamma, p)]$ from 10 and 27 MeV dominated by a peak (see above) at $E_\gamma \approx 25$ MeV with $\sigma \approx 23$ mb.

A study at $E_e = 18.8, 20.8, 25.7$ and 29.7 MeV (reaction (d)) shows a ‘‘pigmy’’ resonance at $E_x = 14.8$ MeV, a shoulder at 15.6 MeV, a peak at 16.7 MeV [probably $\frac{1}{2}^+$ but $\frac{3}{2}^+$ is not ruled out], and the giant dipole resonance, which exhibits a great deal of structure, centered at 22 MeV. The data on the pigmy resonance are consistent with an admixture of $\approx 1\%$ $\frac{3}{2}^-$ (E2) or $\frac{1}{2}^-$ (M1)

to a predominantly $\frac{1}{2}^+$ (E1) state. The experiment shows that for $14 < E_x < 28$ MeV the reaction goes predominantly via $\frac{1}{2}^+$ or $\frac{3}{2}^+$ (E1) states in ^{15}N ; the $T = \frac{3}{2}$ strength is concentrated above 18 MeV: see (1981AJ01).

The cross section for d_0 [reaction (e)] is reported at 90° for $E_\gamma \approx 20.5$ to 28.5 MeV: a resonance is observed at $E_x \approx 21.9$ MeV. The (γ, t_0) cross section (reaction (f)) at 90° decreases from a value of $30 \mu\text{b/sr}$ at 20 MeV to $5 \mu\text{b/sr}$ at 22 MeV and remains flat out to 25 MeV. Comparison of this cross section, and those of the other photonuclear reactions, suggest an isospin splitting of ≈ 6 MeV with the $T = \frac{1}{2}$ strength concentrated between 16 and 21 MeV and the $T = \frac{3}{2}$ strength between 21 and 28 MeV. $^{15}\text{N}^*(21.9)$ is not observed. See (1981AJ01) for references. For reaction (g) [to $^{15}\text{O}_{\text{g.s.}}$] see (1988LI23, 1989KO28). See also (1985GO1A, 1987KIIC; theor.).

44. $^{15}\text{N}(\gamma, \gamma)^{15}\text{N}$

See Table 15.15 and (1981AJ01). See also (1987MO03).

45. $^{15}\text{N}(e, e)^{15}\text{N}$

The charge r.m.s. radius of ^{15}N is 2.612 ± 0.009 fm. The C0 elastic scattering form factor of ^{15}N has been measured over $q = 0.4 - 3.2 \text{ fm}^{-1}$ (1988DE09). Inelastic groups are displayed in Table 15.15.

The giant resonance is split into two main peaks at $E_x = 22$ and 25.5 MeV with some structure around 20 MeV. $\Gamma_{\gamma_0}(\text{C1}) = (1.1 \pm 0.3) \times 10^3$ eV (14 - 18.5 MeV), $\Gamma_{\gamma_0}(\text{C2}) = 12.5 \pm 2.0$ eV assuming the states responsible are $\frac{3}{2}^+$ and $\frac{3}{2}^-$, respectively. For $E_x = 18.5$ to 30 MeV, $\Gamma_{\gamma_0}(\text{C1}) = (1.96 \pm 0.04) \times 10^4$ eV while $\Gamma_{\gamma_0} < 0.1$ eV for any C2 strength. See (1981AJ01, 1986AJ01) for references. See also (1988MUZV; (e, e' γ); prelim.), (1986PA1C, 1987DE43, 1988LI23, 1988PA1S, 1989KO28, 1990PA1H) and (1986JE1B, 1987DO12, 1988FU04, 1988GOZM, 1988SH07, 1989FU05, 1989WO1E, 1990BL09, 1990FU04; theor.).

46. $^{15}\text{N}(\pi^\pm, \pi^\pm)^{15}\text{N}$

At $E_{\pi^\pm} = 164$ MeV angular distributions have been studied to states at $E_x = 10.68 \pm 0.03$, 12.52 ± 0.02 , 14.04 ± 0.03 and 17.19 ± 0.03 MeV: $J^\pi = \frac{9}{2}^+, \frac{9}{2}^+, (\frac{9}{2}^+, \frac{7}{2}^+)$ and $(\frac{9}{2}^+, \frac{7}{2}^+)$, respectively, as well as to the $^{15}\text{N}_{\text{g.s.}}$. Additional π^+ cross sections were measured at 120 and 260 MeV: peaks were observed at $E_x = 20.11 \pm 0.06$ and 23.19 ± 0.06 MeV [both are probably $T = \frac{3}{2}$ states]. $^{15}\text{N}^*(5.27, 6.32, 7.57)$ were also populated (1985SE06). At $E_{\pi^+} = 164$ MeV, elastic scattering has been studied from $^{15}\vec{\text{N}}$: A_y for $\theta = 60^\circ - 100^\circ$ is consistent with zero (1989TA21, 1990TA1L). See also (1990TAZS) and (1988GOZM; theor.).

47. $^{15}\text{N}(n, n)^{15}\text{N}$

See ^{16}N in (1986AJ04). See also (1989FU1J).

48. $^{15}\text{N}(p, p)^{15}\text{N}$

Angular distributions of elastically scattered protons have been measured at E_p to 44.2 MeV: see (1981AJ01, 1986AJ01). For measurements of $K_y^{y'}$ at $E_p = 65$ MeV see (1990NA15). See also ^{16}O in (1986AJ04) and (1990DU01; theor.).

49. (a) $^{15}\text{N}(d, d)^{15}\text{N}$

(b) $^{15}\text{N}(^3\text{He}, ^3\text{He})^{15}\text{N}$

Angular distributions of elastically scattered deuterons have been measured at $E_d = 5 - 6$ MeV. Elastic and inelastic ^3He distributions have been studied for $E(^3\text{He}) = 11$ to 39.8 MeV: see (1976AJ04). Elastic distributions and A_y have also been measured at $E(^3\text{He}) = 33$ MeV (1986DR03).

50. $^{15}\text{N}(\alpha, \alpha)^{15}\text{N}$

At $E_\alpha = 40.5$ MeV, a number of particle groups have been observed and angular distributions have been measured: see Table 15.17 of (1976AJ04). At $E_\alpha = 48.7$ and 54.1 MeV elastic angular distributions have been reported by (1987AB03). See also (1981AJ01) for additional information and (1985SH1D; theor.).

51. $^{15}\text{N}(^7\text{Li}, ^7\text{Li})^{15}\text{N}$

The elastic scattering has been studied at $E(^7\text{Li}) = 28.8$ MeV: see (1986AJ01).

52. (a) $^{15}\text{N}(^{12}\text{C}, ^{12}\text{C})^{15}\text{N}$

(b) $^{15}\text{N}(^{13}\text{C}, ^{13}\text{C})^{15}\text{N}$

(c) $^{15}\text{N}(^{14}\text{C}, ^{14}\text{C})^{15}\text{N}$

Angular distributions of elastic scattering have been measured at $E(^{15}\text{N}) = 31.5$ to 47 MeV [reaction (a)] and $E(^{13}\text{C}) = 105$ MeV [reaction (b)]: see (1981AJ01, 1986AJ01) [also for yield measurements]. See also (1986HA1F, 1989BEZC) and (1985HU04, 1986BA69, 1986HA13; theor.).

53. $^{15}\text{N}(^{16}\text{O}, ^{16}\text{O})^{15}\text{N}$

Elastic angular distributions have been measured at $E(^{16}\text{O}) = 35.1$ and 42.6 MeV: see (1986AJ01). For fusion cross sections and yields see (1976AJ04, 1986AJ01) and (1985NO1C, 1986HA1F). See also (1985HU04; theor.).

54. (a) $^{15}\text{N}(^{27}\text{Al}, ^{27}\text{Al})^{15}\text{N}$
 (b) $^{15}\text{N}(^{28}\text{Si}, ^{28}\text{Si})^{15}\text{N}$

Elastic distributions have been measured in the range $E(^{15}\text{N}) = 32.8$ to 69.8 MeV [reaction (a)] and at 44 MeV [reaction (b)]: see (1981AJ01, 1986AJ01). See also (1988SN1A).

55. $^{15}\text{O}(\beta^+)^{15}\text{N}$ $Q_m = 2.7539$

See ^{15}O .

56. (a) $^{16}\text{O}(\gamma, p)^{15}\text{N}$ $Q_m = -12.1276$
 (b) $^{16}\text{O}(e, ep)^{15}\text{N}$ $Q_m = -12.1276$

Over the giant resonance region in ^{16}O , the decay takes place to the odd-parity states $^{15}\text{N}^*(0, 6.32)$ and less strongly to the even-parity states $^{15}\text{N}^*(5.27, 5.30, 8.31, 9.05)$ and to $^{15}\text{N}^*(9.22)$: see (1970AJ04, 1976AJ04). At $E_e = 500$ MeV most of the $1p$ hole strength is concentrated in the groups to $^{15}\text{N}^*(0, 6.32)$. The $1s$ state shows up as a very wide asymmetric structure centered at $E_x \approx 41$ MeV: see (1981AJ01). See also (1990LE1P). In the range $E_\gamma = 101.5$ to 382 MeV differential cross sections are reported for the p_0 , (p_{1+2}) and p_3 groups at $\theta = 45^\circ, 90^\circ$ and 135° (1985LE07). Differential cross sections have also been measured at $E_\gamma = 196, 257, 312, 316$ MeV for the p_0 and $p_{1\rightarrow 3}$ groups [the latter not at 316 MeV] (1988AD07, 1985TU02). $^{15}\text{N}^*(0, 6.3, 10.8)$ have been populated at $E_e = 500$ MeV (1982BE02). See also (1986AJ01), (1987VOZR, 1988LEZW, 1989LEZY; prelim.), (1987MA1K) and (1985CA17, 1985GO1B, 1986CH05, 1986LU1A, 1986PO14, 1987RY03, 1988CA10, 1988DUZX, 1988HO10, 1988YA08, 1988LO07, 1988MC03, 1988RY03, 1989RY01, 1990BRZY, 1990FL1A, 1990OWZZ; theor.).

$$57. {}^{16}\text{O}(\mu^-, \nu\text{n})^{15}\text{N} \quad Q_{\text{m}} = 92.7492$$

Gamma rays from the decay of one of the states at 5.3 MeV and from ${}^{15}\text{N}^*(6.3)$ are reported by (1983VA1E).

$$58. {}^{16}\text{O}(\text{n}, \text{d})^{15}\text{N} \quad Q_{\text{m}} = -9.9030$$

Angular distributions of the d_0 group have been reported at $E_{\text{n}} = 14$ and 14.4 MeV: see (1976AJ04). See also (1988YOZX; $E_{\text{n}} = 60$ MeV; prelim.) and (1990MC04; applied).

$$59. \text{(a) } {}^{16}\text{O}(\pi^\pm, \pi^\pm\text{p})^{15}\text{N} \quad Q_{\text{m}} = -12.1276$$

$$\text{(b) } {}^{16}\text{O}(\text{p}, 2\text{p})^{15}\text{N} \quad Q_{\text{m}} = -12.1276$$

At $E_{\pi^\pm} = 240$ MeV, the spectra are dominated by ${}^{15}\text{N}^*(0, \approx 6.5)$. The π^+/π^- ratio has been measured for the ground-state transitions (1984KY01). At $E_{\pi^+} = 2.0$ GeV/ c differential cross sections have been determined for the transition to ${}^{15}\text{N}^*(6.3)$ (1983KI01).

At $E_{\text{p}} = 505$ MeV the summed proton spectrum shows two peaks corresponding to the knockout of $\text{p}_{1/2}$ and $\text{p}_{3/2}$ protons with binding energies of 12.12 and 18.44 MeV [${}^{15}\text{N}^*(0, 6.32)$]. Differential cross sections and (p, 2p)/(p, pn) ratios are also reported (1986MC10). For work at 1 GeV involving the knockout of $\text{s}_{1/2}$ protons see (1985BE30). For γ -ray production (${}^{15}\text{N}^*(5.27)$) at $E_{\text{p}} = 30 - 40$ MeV see (1988LE08). See also (1985KI1A, 1986CHI1J, 1987VD1A), (1987LA11, 1988LE08; astrophys.) and (1986BO1A; theor.). For earlier work see (1976AJ04).

$$60. {}^{16}\text{O}(\text{d}, {}^3\text{He})^{15}\text{N} \quad Q_{\text{m}} = -6.6340$$

Angular distributions of ${}^3\text{He}$ groups have been measured for $E_{\text{d}} = 20$ to 82 MeV: see (1976AJ04, 1981AJ01). The spectra are dominated by the transitions to ${}^{15}\text{N}^*(0, 6.32)$. A ZRDWBA analysis leads to $C^2S = 2.25$ and 3.25 for these two states [and to 2.37 and 3.31 for the analog states in ${}^{15}\text{O}$ studied with the (d, t) reaction]. $J^\pi = \frac{3}{2}^-$ for both ${}^{15}\text{N}^*(9.93, 10.70)$: see (1981AJ01). See also (1987MO03) for a re-analysis of C^2S .

$$61. {}^{16}\text{O}(\alpha, \text{ap})^{15}\text{N} \quad Q_{\text{m}} = -12.1276$$

At $E_{\alpha} = 139.2$ MeV the absolute spectroscopic factors $S = 5.4$ and 6.9 for ${}^{15}\text{N}^*(0, 6.32)$ (1987SA01).

62. (a) $^{16}\text{O}(^6\text{Li}, ^7\text{Be})^{15}\text{N}$ $Q_m = -6.522$
 (b) $^{16}\text{O}(^7\text{Li}, ^8\text{Be})^{15}\text{N}$ $Q_m = 5.1268$
 (c) $^{16}\text{O}(^{16}\text{O}, ^{17}\text{F})^{15}\text{N}$ $Q_m = -11.5274$

For reaction (a) see (1986GL1E). For reaction (b) see (1988MA07) and for (c) see (1988AU03). For other heavy-ion reactions see (1981AJ01, 1986AJ01).

63. $^{17}\text{O}(\text{p}, ^3\text{He})^{15}\text{N}$ $Q_m = -8.5529$

At $E_p = 39.8$ MeV angular distributions of the groups to $^{15}\text{N}^*(0, 6.32)$ have been compared with those to the analog states in ^{15}O reached in the (p, t) reaction: see (1976AJ04).

64. $^{18}\text{O}(\text{p}, \alpha)^{15}\text{N}$ $Q_m = 3.9804$

Angular distributions of α_0 have been measured for $E_p = 0.125$ to 42.2 MeV: see (1976AJ04, 1981AJ01) and ^{19}F in (1987AJ02). At $E_p = 40.9$ MeV angular distributions have also been studied to $^{15}\text{N}^*(0, 5.27 + 5.30, 6.32, 7.57, 9.15[\text{u}], 9.83[\text{u}], 10.7[\text{u}], 11.24[\text{u}], 11.44, 12.52[\text{u}])$ (1987CA15; see for C^2S).

For $^{15}\text{N}^*(5.27)$, $\tau_m = 2.49 \pm 0.24$ ps, $|g| = 0.94 \pm 0.07$ (1983BI10). See also (1986CO1F), (1988FI1C, 1989NW1A, 1990MI15; applied) and (1986BA89, 1988CA26; astrophys.).

65. $^{19}\text{F}(\text{d}, ^6\text{Li})^{15}\text{N}$ $Q_m = -2.5388$

Angular distributions involving $^{15}\text{N}^*(0, 5.3, 6.3)$ have been measured in the range $E_d = 9.0$ to 28 MeV [see (1976AJ04, 1981AJ01)].

66. $^{19}\text{F}(^3\text{He}, ^7\text{Be})^{15}\text{N}$ $Q_m = -2.4265$

See (1976AJ04) and (1986HA1E; theor.).

Table 15.16: Energy levels of ^{15}O ^a (continued)

E_x in ^{15}O (MeV \pm keV)	$J^\pi; T$	τ or $\Gamma_{\text{c.m.}}$ (keV)	Decay	Reactions
19.91 \pm 50			n, ^3He	3
20.42 \pm 70	$(\frac{3}{2}, \frac{1}{2})^+; \frac{1}{2}$	970 \pm 240	γ , p, ^3He	3, 9
21.56 \pm 70	$(\frac{3}{2}, \frac{1}{2})^+; \frac{1}{2}$	730 \pm 120	γ , p, ^3He	3, 9, 23
23.8 \pm 0.1		\lesssim 500	γ , ^3He	3
(26.0)	$(\frac{13}{2}^-)$	\approx 600	^3He	3
(28.0)	$(\frac{9}{2}^-, \frac{11}{2}^-)$	\approx 2500	^3He	3
(29.0)		\approx 2500	^3He	3

^aSee also Table 15.17.

^b It is possible that these two are in fact a single state: see (1976AJ04).

For reaction (a) see (1986BE54); for reaction (b) see (1986BE35). For other heavy-ion reactions see (1986AJ01).

3. (a) $^{12}\text{C}(^3\text{He}, \gamma)^{15}\text{O}$	$Q_m = 12.0759$	
(b) $^{12}\text{C}(^3\text{He}, \text{n})^{14}\text{O}$	$Q_m = -1.1466$	$E_b = 12.0759$
(c) $^{12}\text{C}(^3\text{He}, \text{p})^{14}\text{N}$	$Q_m = 4.7789$	
(d) $^{12}\text{C}(^3\text{He}, \text{d})^{13}\text{N}$	$Q_m = -3.5500$	
(e) $^{12}\text{C}(^3\text{He}, \text{t})^{12}\text{N}$	$Q_m = -17.357$	
(f) $^{12}\text{C}(^3\text{He}, ^3\text{He})^{12}\text{C}$		
(g) $^{12}\text{C}(^3\text{He}, \alpha)^{11}\text{C}$	$Q_m = 1.8560$	

Excitation functions and polarization measurements for these reactions have been measured over a wide range of energies: see Tables 15.20 in (1970AJ04, 1976AJ04, 1981AJ01) and the text below. Observed resonances are displayed in Table 15.18 here.

The 90° yield and the angular distributions of γ_0 , measured from $E(^3\text{He}) = 5.24$ to 13.95 MeV show five resonances attributed to E1 transitions from $J^\pi = \frac{1}{2}^+$ or $\frac{3}{2}^+$, $T = \frac{1}{2}$ states in the GDR characterized by a considerable 3p4h admixture (1978DE33 [also for ω_γ], 1984DE09). Yields of γ_{1+2} at 90° have also been reported at $E(^3\text{He}) = 5.3$ to 16.7 MeV: the cross section is some eight times greater than that for $(^3\text{He}, \gamma_0)$ and is similar to that for the $^{14}\text{N}(\text{p}, \gamma_0)^{15}\text{O}$ reaction over the same excitation range. Three resonances are reported [see Table 15.18 (1989KI09)]: it is suggested that they are due to cluster states with a large 3p4h component. See also (1988BLZY; prelim.; $E(^3\text{He}) = 12.0$ to 24.6 MeV; γ to many states of ^{15}O).

Table 15.17: Radiative decays in ^{15}O ^a

- ^a For references and other comments see Table 15.19 in (1981AJ01).
- ^b δ =multipole mixing ratio.
- ^c Branches to $^{15}\text{O}^*(5.18, 5.24)$ are $< 2.5\%$ each.
- ^d Branches to $^{15}\text{O}^*(5.18, 5.24, 6.18)$ are < 3 , < 3 and $< 7\%$, respectively.
- ^e Branches to $^{15}\text{O}^*(0, 5.18, 6.18)$ are < 10 , < 4 and $< 0.4\%$, respectively.
- ^f Branches to $^{15}\text{O}^*(5.18, 6.18)$ are < 4 and $< 2\%$, respectively.
- ^g Branchings shown to $^{15}\text{O}^*(5.18, 6.18, 6.79)$ are weighted means of values shown in Table 15.19 of (1981AJ01), recalculated to sum to 100% for all the transitions.
- ^h (1987SC1H).
- ⁱ See, however, the comments in reaction 14 of (1981AJ01).
- ^j Branchings to $^{15}\text{O}^*(6.18, 6.86)$ are $< 1\%$ each.
- ^k Weighted mean of values shown in Table 15.19 of (1981AJ01).
- ^l Intensity $< 25\%$ of transition to $^{15}\text{O}^*(6.79)$.
- ^m Recalculated because of new transition to $^{15}\text{O}^*(\frac{1}{2}^+)$ (1987SC1H).
- ⁿ Γ_γ values assume J -values in column 2.

The yield of n_0 (reaction (b)) shows resonances for $E(^3\text{He}) < 10$ MeV and little structure above, to 30.6 MeV: see (1981AJ01) [n_1 and n_{2+3+4} yields are also reported].

The yield of protons (reaction (c)) shows some clear resonances below $E(^3\text{He}) = 4.5$ MeV and some uncorrelated structures at higher energies (to $E(^3\text{He}) = 12$ MeV) with the possible exception of states at $E_{\text{res}} = 7.8, 9.2 - 9.6$ and (10.5) MeV. For $E(^3\text{He}) = 16$ to 30.6 MeV no appreciable structure is observed in the p_0, p_1 and p_2 yields: see (1976AJ04). At $E(^3\vec{\text{He}}) = 33$ MeV A_y has been measured for $^{14}\text{N}^*(0, 2.31, 3.95)$: see (1986AJ01). For polarization effects in the ($^3\text{He}, 2p$) reaction at $E(^3\vec{\text{He}}) = 33$ MeV see (1986KA44). For reactions (d) and (e) see (1976AJ04, 1981AJ01, 1986AJ01).

The elastic scattering (reaction (f)) shows some resonant structure near 3, 5 and 6 MeV and some largely uncorrelated structures in the range $E(^3\text{He}) = 16.5$ to 24 MeV. There is some suggestion, however, of two resonances at $E(^3\text{He}) = 17$ and 20 MeV: see (1976AJ04). Resonance-like behavior is also reported at $E(^3\vec{\text{He}}) = 29$ MeV. Polarization measurements are reported for $E(^3\vec{\text{He}}) = 20.5$ to 32.6 MeV: see (1981AJ01). See also (1986AJ01). The yield of α -particles displays resonance structure below 8 MeV, and broad fluctuations for $E(^3\text{He}) = 12$ to 18.6 MeV: see (1976AJ04). Polarization measurements are reported for $E(^3\vec{\text{He}}) = 33.3$ MeV for the α_0 and α_1 groups: see (1981AJ01). For A_y measurements of the ($^3\text{He}, ^7\text{Be}$) and ($^3\text{He}, ^6\text{Li}$) reactions see (1989SI02, 1986CL1B). For π^\pm production see (1986MI25). For a search for subthreshold K^+ production see (1985IA01). For work at very high energies see (1985AB1B, 1985AD1C). See also (1986AJ01), (1984NA1F), (1990TO10; applied) and (1986EV01, 1986SI02; theor.).

$$4. \ ^{12}\text{C}(\alpha, n)^{15}\text{O} \quad Q_m = -8.5019$$

Angular distributions of the n_0 group have been measured for $E_\alpha = 18.4$ to 23.1 MeV: see (1976AJ04). At $E_\alpha = 41$ MeV angular distributions are reported to $^{15}\text{O}^*(5.24, 6.86+7.28, 9.63[\text{u}],$

10.48[u], 11.72[u], 12.85[u], 15.05[u]). $^{15}\text{O}^*(8.92, 11.1, 12.3, 13.45, 13.72, 14.27, 15.65)$ are also populated (1981OV01 [uncertainties in E_x are not shown; unresolved states are a problem]). At $E_\alpha = 47.4$ MeV groups are populated at $\theta = 0^\circ$ corresponding to $^{15}\text{O}_{\text{g.s.}}$ and to unresolved states at 5.2, 7.3, 10.0, 12.5 and 15.3 MeV (1988LU02). See also (1988CA26; astrophys.).

Table 15.18: Resonances in $^{12}\text{C} + ^3\text{He}$ ^a

$E(^3\text{He})$ (MeV \pm keV)	Resonant for	$\Gamma_{\text{c.m.}}$ (keV)	J^π	E_x (MeV)

(17.0) ^d	^3He	≈ 600	$(\frac{13}{2}^-)$	(26.0)
(20.0) ^d	^3He	≈ 2500	$(\frac{9}{2}^-, \frac{11}{2}^-)$	(28.0)
(21.5)	^3He to $^{12}\text{C}^*(15.1)$	≈ 2500		(29.0)

^a For references see Table 15.21 in (1976AJ04).

^b (1978DE33, 1984DE09 [see p.290]); $T = \frac{1}{2}$; $\Gamma_{^3\text{He}}/\Gamma_{\text{p}} = 0.17 \pm 0.07$ and 0.09 ± 0.04 for $^{15}\text{O}^*(17.05, 18.67)$.

^c (1989KI09). See also for ω_γ . See also Table 15.19 in (1986AJ01); $T = \frac{1}{2}$ if they are 3p4h cluster states.

^d $\Gamma_{\text{p}} = 0.06$ and $\geq 0.1 \text{ MeV}$ for $^{15}\text{O}^*(26, 28)$.

^e Estimated by reviewer.

5. $^{12}\text{C}(^6\text{Li}, \text{t})^{15}\text{O}$ $Q_{\text{m}} = -3.7196$

States observed in this reaction are displayed in Table 15.19 (1975BI06: $E(^6\text{Li}) = 59.8 \text{ MeV}$). Comparisons of angular distributions of the triton groups in this reaction and of the ^3He groups to analog states in ^{15}N have been made: analog correspondence is established for (10.48 – 10.70), (12.84 – 13.15 (u)) and (15.05 – 15.49 (u)) [E_x in ^{15}O , E_x in ^{15}N ; u = unresolved] (1975BI06). See also (1976AJ04) for the earlier work.

6. $^{12}\text{C}(^{12}\text{C}, ^9\text{Be})^{15}\text{O}$ $Q_{\text{m}} = -14.2031$

At $E(^{12}\text{C}) = 187 \text{ MeV}$, $\theta_{\text{lab}} = 8^\circ$, the spectrum is dominated by $^{15}\text{O}^*(12.84, 15.05)$ [assumed $J^\pi = \frac{1}{2}^-, \frac{13}{2}^+$, respectively]. $^{15}\text{O}^*(7.28)$ [$J^\pi = \frac{7}{2}^+$] is populated but $^{15}\text{O}^*(0, 6.79)$ are not observed. The situation is similar at $E(^{12}\text{C}) = 114 \text{ MeV}$ but at $E(^{12}\text{C}) = 72 \text{ MeV}$ ($\theta_{\text{lab}} = 11^\circ$) $^{15}\text{O}^*(0, 5.2, 7.28)$ are populated with comparable intensities: see (1976AJ04).

At $E(^{12}\text{C}) = 480 \text{ MeV}$ the three most strongly excited states in the forward direction are $^{15}\text{O}^*(10.46, 12.83[\text{u}], 15.05[\text{u}])$ [$J^\pi = \frac{9}{2}^+, \frac{11}{2}^-, \frac{13}{2}^+$] and forward angle $\sigma(\theta)$ have been measured. $^{15}\text{O}^*(0, 5.24, 7.3, 8.9[\text{u}], 16.7[\text{u}], 18.2[\text{u}], 21.1[\text{u}], 22.1[\text{u}])$ are also populated (1988KR11).

Table 15.19: Levels of ^{15}O from $^{12}\text{C}(^6\text{Li}, t)^{15}\text{O}$ ^a

11.56 \pm 10			

^a (1975BI06): $E(^6\text{Li}) = 59.8$ MeV.

^b Angular distributions measured and compared with those of the ($^6\text{Li}, ^3\text{He}$) reaction to analog states in ^{15}N .

^c Angular distribution measured: analog states in ^{15}N not known.

^d Unresolved in angular distribution.

^e $\Gamma_\gamma/\Gamma < 0.13$.

7. $^{13}\text{C}(^3\text{He}, n)^{15}\text{O}$ $Q_m = 7.1296$

Observed groups are displayed in Table 15.22 of (1981AJ01).

8. $^{14}\text{C}(p, \pi^-)^{15}\text{O}$ $Q_m = -132.115$

At $E_p = 183$ MeV differential cross sections and A_γ are reported for the transitions to $^{15}\text{O}^*(0, 7.3)$, the two states strongly populated in the reaction (1982JA05, 1982VI05). See also (1986JA1H) and (1986KU1J, 1990KU1H; theor.).

9. $^{14}\text{N}(p, \gamma)^{15}\text{O}$ $Q_m = 7.2971$

Observed resonances in the yield of γ -rays are listed in Table 15.20. Branching ratios are displayed in Table 15.17. Measurements of E_γ lead to $E_x = 5183 \pm 1, 5240.9 \pm 0.4, 6175 \pm 2, 6794 \pm 2, 6858 \pm 2, 8284.1 \pm 0.8, 8922 \pm 2$ and 8978 ± 2 keV: see (1981AJ01). For τ_m see (1981AJ01).

(1987SC1H) have studied absolute cross sections, γ -ray angular distributions and excitation functions for $E_p = 0.2$ to 3.6 MeV: $S(0)$ is determined to be 3.20 ± 0.54 keV \cdot b. C^2S are derived for the first eight states of ^{15}O (1987SC1H).

The 90° γ_0 yield has been measured for $E_p = 2.2$ to 19 MeV: resonances are observed over most of the range. The $(\gamma_1 + \gamma_2)$ yield is relatively weak. For $E_p = 18$ to 28 MeV the excitation function for γ_0 decreases smoothly with energy: there is no evidence for structures [see (1981AJ01)]. See also (1985CA41, 1987KR04, 1987WE1C, 1988CA1J, 1988CA26, 1989BA2P, 1989TH1C, 1990MA1P; astrophysics) and (1990HA46; theor.).

10. $^{14}\text{N}(p, n)^{14}\text{O}$ $Q_m = -5.9255$ $E_b = 7.2971$

The excitation function has been measured for $E_p = 6.3$ to 12 MeV: see (1970AJ04). Observed resonances are displayed in Table 15.20. The cross section [obtained by measuring the 2.31 MeV γ -rays from the ^{14}O (β^+) decay] is reported at 12 energies in the range $E_p = 7$ to 22 MeV (1981DY03). Production cross sections for the 2.31 MeV γ -rays have been measured at $E_p = 8.9, 20, 30, 33$ and 40 MeV by (1988LE08). The ratio of the cross section to $^{14}\text{O}_{\text{g.s.}}$ to that for the analog state $^{14}\text{N}^*(2.31)$ [from the (p, p') reaction] has been determined at $E_p = 35$ MeV (1984TA02). Forward-angle differential cross sections (n_0) are reported by (1979MO16) at $E_p = 144$ MeV. See also (1985CA41; astrophys.) and ^{14}O .

11. $^{14}\text{N}(p, p)^{14}\text{N}$ $E_b = 7.2971$

The yields of elastic and inelastic protons, and of 2.31 MeV γ -rays, have been studied at many energies: see (1959AJ76, 1970AJ04, 1976AJ04). Observed resonances are displayed in Table 15.20. At higher energies excitation functions have been measured for the p_0, p_1 and p_2 groups for $E_p = 17$ to 26.5 MeV: there is no evidence for resonant behavior but the p_1 yield shows a large increase between $E_p = 20$ and 23 MeV. Total cross sections for the $p_0 \rightarrow p_9$ groups have been measured at $E_p = 8.6, 10.6, 12.6$ and 14.6 MeV [see (1981AJ01)]. Total reaction cross sections

have also been measured in the range $E_p = 22.9$ to 49.0 MeV by (1985CA36). (1988LE08) report 2.31–MeV γ -ray production cross sections at $E_p = 8.9, 20, 30, 33$ and 40 MeV. For measurements at $E(^{14}\text{N}) = 516$ MeV/A see (1990WE14).

Polarization measurements have been carried out at $E_p = 3.0$ to 159.4 MeV [see (1970AJ04, 1976AJ04, 1986AJ01)] and at $E_{\bar{p}} = 35$ MeV (1990IE01; p_1) and 0.8 GeV (1985BL22; A_y ; elastic). See also ^{14}N , (1986BA2U), (1986BA88, 1987HU01) and (1989AM01; theor.).

Table 15.20: Resonances in $^{14}\text{N} + p$ ^a

E_p (keV)	Γ_{lab} (keV)	$\omega\Gamma_\gamma$ (eV)	Particles out	J^π	E_x (MeV)

^a For references see (1970AJ04, 1976AJ04, 1981AJ01). See also Table 15.17 here.

^b (1987SC1H). See also (1987KR04; theor.).

^c Separated by 0.5 ± 0.5 keV: see, however, reaction 14 in (1981AJ01).

^d Weak.

^e Strong.

^f See footnote ^e in Table 15.23 of (1981AJ01).

$$Q_m = -4.7789$$

$$E_b = 7.2971$$

Excitation functions for the ground-state group have been measured at $E_p = 7$ to 11 MeV: some resonant structure is indicated [see Table 15.20]. See also (1976AJ04).

$$Q_m = -2.9228$$

$$E_b = 7.2971$$

Excitation functions and total cross-section measurements have been measured for the α_0 group for $E_p = 3.8$ to 45 MeV: see (1976AJ04). Fairly sharp structures persist until $E_p = 15$ MeV: see Table 15.20 here and footnote ^e in Table 15.23 of (1981AJ01). See also (1986AI04; applied) and (1985CA41; astrophys.).

$$Q_m = 5.0725$$

Table 15.21: Levels of ^{15}O from $^{14}\text{N}(\text{d}, \text{n})$ and $^{14}\text{N}({}^3\text{He}, \text{d})$ ^a

E_x in ^{15}O ^b (MeV \pm keV)	l_p	S	J^π
0	1 ^d	0.87	$\frac{1}{2}^-$
5.18	(0) ^e	0	$\frac{1}{2}^+$
5.2410 ± 0.5 ^c	2 ^d	(0.03)	$\frac{5}{2}^+$
6.180 ± 4 ^c	1 ^d	0.04	$\frac{3}{2}^-$
6.79	0 ^d	≤ 0.3	$\frac{3}{2}^+$
6.8598 ± 1.0 ^c	2 ^d	0.4	$\frac{5}{2}^+$
7.2762 ± 0.6 ^c	2 ^d	0.42	$\frac{7}{2}^+$
7.56	0 ^d	≤ 0.4	$\frac{1}{2}^+$
8.28	0 ^e		$\frac{3}{2}^+$

^a See Tables 15.27 in (1970AJ04) and 15.26 in (1976AJ04) for references and additional information.

^b Nominal energies if uncertainty is not indicated.

^c From γ -ray measurements.

^d From both (d, n) and (${}^3\text{He}$, d) work: see (1976AJ04).

^e From (${}^3\text{He}$, d).

Angular distributions have been studied at many energies in the range $E_d = 0.9$ to 11.8 MeV: see Tables 15.27 and 15.28 in (1970AJ04) and Table 15.26 in (1976AJ04). For τ_m measurements see (1970AJ04). See also Table 15.21 here, ^{16}O in (1986AJ04), (1987HI1B; applied) and (1984BL21; theor.).

$$15. \quad {}^{14}\text{N}({}^3\text{He}, \text{d})^{15}\text{O} \quad Q_m = 1.8035$$

See Table 15.28 in (1970AJ04). See also Table 15.21 here.

$$16. \quad {}^{15}\text{N}(\gamma, \pi^-)^{15}\text{O} \quad Q_m = -142.322$$

At $E_\gamma = 170$ MeV four-point angular distributions of the π^- to $^{15}\text{O}_{\text{g.s.}}$ have been measured by (1988LI23) and (1989KO28): the two studies are not in good agreement. See also (1990ER03; theor.).

17. $^{15}\text{N}(\pi^+, \pi^0)^{15}\text{O}$ $Q_m = 1.850$

Angular distributions of the π^0 to $^{15}\text{O}_{\text{g.s.}}$ have been studied at $E_{\pi^+} = 32.4$ and 55.5 MeV (1985IR02), at 48 MeV (1984CO04, 1986LE01) and at 165 MeV (1982DO10). Forward-angle differential cross sections of the π^0 to $^{15}\text{O}_{\text{g.s.}}$ have also been measured at $E_{\pi^+} = 20$ MeV (1987IR01) and at 40.7 and 63.6 MeV (1985IR02). See also (1989LE1L).

18. $^{15}\text{N}(\text{p}, \text{n})^{15}\text{O}$ $E_m = -3.5363$

Angular distributions have been measured for $E_p = 3.95$ to 18.5 MeV [see (1981AJ01, 1986AJ01)], at 35 MeV (1987OR01; $^{15}\text{O}^*(7.56)$ [$J^\pi = \frac{1}{2}^+$]), at 135 MeV (1985WA24; $^{15}\text{O}^*(0, 6.2)$) and at 200 and 494 MeV (1988CIZZ; prelim.; also A_y). Forward-angle differential cross sections at $E_p = 200, 300$ and 400 MeV to $^{15}\text{O}^*(0, 6.2)$ are reported by (1987ALZW; prelim.). The ratio of the population of $^{15}\text{O}_{\text{g.s.}}$ to that of $^{15}\text{O}^*(6.2)$ has been determined at $E_p = 800$ MeV (1986KI12). $^{15}\text{O}^*(6.2)$ contains only about $\frac{1}{3}$ of the expected GT strength (1985GO02). [I am indebted to Prof. C.D. Goodman for his comments.] For a discussion of GT strengths, see (1987TA13). $^{15}\text{O}^*(5.2[\text{u}], 6.8[\text{u}], 7.28)$ have also been populated (1987OR01). For the earlier work see (1986AJ01). See also ^{16}O in (1986AJ04), (1985GO1Q, 1986VO1G, 1987BE25, 1988RO17, 1988WA1Q), (1986MA1P, 1987HI1B, 1988HI1F; applied) and (1989RA15; theor.).

19. $^{15}\text{N}(^3\text{He}, \text{t})^{15}\text{O}$ $Q_m = -2.7725$

Angular distributions for the $t_0, t_{1+2}, t_3, t_{4+5}, t_6$ and t_7 groups have been studied for $E(^3\text{He}) = 16.5$ to 44.6 MeV: see (1976AJ04).

20. $^{16}\text{O}(\gamma, \text{n})^{15}\text{O}$ $Q_m = -15.6638$

The spectrum of photoneutrons has been investigated at many energies. Measurements over the giant dipole resonance region show the predominant strength is to the $J^\pi = \frac{1}{2}^-$ and $\frac{3}{2}^-$ states $E_x = 0$ and 6.18 MeV, consistent with the basic validity of the single-particle, single-hole theory of photoexcitation in ^{16}O . However, the positive-parity states at $E_x = 5.18, 5.24, 6.86$ MeV are also populated suggesting some more complicated excitations in ^{16}O : see (1970AJ04, 1976AJ04). Differential cross sections for the n_0 group have been measured from threshold to $E_\gamma = 28$ MeV [see (1976AJ04)], at $E_\gamma = 60$ to 160 MeV (also $^{15}\text{O}^*(6.18)$; no appreciable strength in the 5.2 MeV doublet) [see (1986AJ01)] and at $150, 200$ and 250 MeV (1989BE14). See also ^{16}O in (1986AJ04) and (1987RY03, 1988CA10, 1988DUZX, 1988RY03, 1990BRZY, 1990FL1A; theor.).

21. (a) $^{16}\text{O}(\pi^+, p)^{15}\text{O}$ $Q_m = 124.687$
 (b) $^{16}\text{O}(\pi^+, \pi^+n)^{15}\text{O}$ $Q_m = -15.6638$
 (c) $^{16}\text{O}(\pi^+, \pi^0p)^{15}\text{O}$ $Q_m = -10.277$

For reaction (a) see (1982DO01). At $E_{\pi^+} = 2.0$ GeV/c differential cross sections have been determined for the transition to $^{15}\text{N}^*(6.2)$ (1983KI01) in reaction (b). For reaction (c), see (1986GI1A).

22. $^{16}\text{O}(p, pn)^{15}\text{O}$ $Q_m = -15.6638$

At $E_p = 505$ MeV the summed spectra show two peaks corresponding to the $p_{1/2}$ and $p_{3/2}$ knockouts [$^{15}\text{O}^*(0, 6.18)$] (binding energies of 15.64 and 21.82 MeV). Differential cross sections are also reported (1986MC10) [see also reaction 59 in ^{15}N]. For work at 1 GeV, see (1985BE30). See also (1983WA1C) and (1987HI1B; applied).

23. $^{16}\text{O}(p, d)^{15}\text{O}$ $Q_m = -13.4392$

Angular distributions have been reported at many energies for $E_p = 18.5$ to 155.6 MeV [see Table 15.30 in (1970AJ04), (1976AJ04), (1986AJ01)]: at those energies $^{15}\text{O}^*(0, 6.18)$ are preferentially populated. At $E_p = 200$ MeV angular distributions have been studied for $^{15}\text{O}^*(0, 6.18)$ (1989AB01) [also A_y and C^2S]. At $E_p = 800$ MeV $^{15}\text{O}^*(0, 5.2[\text{u}], 6.18, 7.4[\text{u}], 9.0[\text{u}], 10.42 \pm 0.15, 10.87 \pm 0.15, 12.21 \pm 0.15, 13.59 \pm 0.15, 19.0 \pm 0.2, 21.1 \pm 0.2)$ [the last two states have $\Gamma \geq 0.8$ MeV] have been populated (1984SM04).

For γ -ray production [$^{15}\text{O}^*(5.24)$] see (1988LE08). See also ^{17}F in (1986AJ04), (1989WA16) and (1987LA11, 1988LE08, 1989GU28; astrophysics).

24. $^{16}\text{O}(d, t)^{15}\text{O}$ $Q_m = -9.4065$

Angular distributions have been reported at a number of energies in the range $E_d = 20$ to 52 MeV [see (1981AJ01) and reaction 60 in ^{15}N here] and at $E_d = 89$ MeV (1990SA27; $^{15}\text{O}^*(0, 6.18)$). See also ^{18}F in (1983AJ01).

25. $^{16}\text{O}(^3\text{He}, \alpha)^{15}\text{O}$ $Q_m = 4.9140$

The $p_{1/2}$ and $p_{3/2}$ hole states $^{15}\text{O}^*(0, 6.18)$ are strongly populated. Information on these and other states are displayed in Table 15.25 of (1981AJ01). Angular distributions have been measured at energies up to $E(^3\text{He}) = 217$ MeV: see (1981AJ01). Branching ratios and multipole mixing ratios are displayed in Table 15.17. (1978BE73) report τ_m of $^{15}\text{O}^*(5.24) = 3.25 \pm 0.30$ ps, $|g| = 0.260 \pm 0.028$. (1983BI10) determine $g = +0.17 \pm 0.07$. See also (1986AJ01), ^{19}Ne in (1983AJ01) and (1990AB14; applied).

$$26. \ ^{16}\text{O}(^6\text{Li}, ^7\text{Li})^{15}\text{O} \quad Q_m = -8.414$$

See (1986GL1E; prelim.).

$$27. \ ^{17}\text{O}(p, t)^{15}\text{O} \quad Q_m = -11.3254$$

At $E_p = 39.8$ MeV angular distributions of t_0 and t_3 groups have been compared to those of the ^3He groups to the analog states in ^{15}N . At $E_p = 45$ MeV a state, assumed to be the $J^\pi = \frac{5}{2}^+$, $T = \frac{3}{2}$ analog of $^{15}\text{C}^*(0.74)$, is observed at $E_x = 12.255 \pm 0.013$ MeV, $\Gamma_{\text{c.m.}} = 135 \pm 15$ keV. The state decays by proton emission to the $T = 1, 0^+$ state $^{14}\text{N}^*(2.31)$ [the population of some $T = \frac{1}{2}$ states is also reported]: see (1981AJ01).

$E_{\bar{p}} = 89.7$ MeV angular distributions and A_y measurements have been reported to $^{15}\text{O}^*(0, 5.24[\text{u}], 6.18, 6.86, 7.28)$ (1985VO12).

$$28. \ ^{19}\text{F}(^3\text{He}, ^7\text{Li})^{15}\text{O} \quad Q_m = -4.3185$$

See (1976AJ04). See also (1986HA1E; theor.).

^{15}F
(Fig. 4)

GENERAL (See also (1986AJ01)).

See (1989AYZU, 1989OG1B) and (1985AN28, 1986AN07, 1988CO15; theor.). See (1986AN07) for comments on ^{15}Ne .

Mass of ^{15}F : The atomic mass excess of ^{15}F is 16.77 ± 0.13 MeV. ^{15}F is unstable with respect to breakup into $^{14}\text{O} + p$ by 1.47 MeV: see (1981AJ01).

$$1. \ ^{12}\text{C}(^3\text{He}, \pi^-)^{15}\text{F} \quad Q_m = -141.41$$

Table 15.22: Energy levels of ^{15}F

E_x in ^{15}F (MeV)	$J^\pi; T$	$\Gamma_{\text{c.m.}}$ (MeV)	Decay	Reaction
g.s.	$(\frac{1}{2}^+); \frac{3}{2}$	1.0 ± 0.2	p	2
1.3 ± 0.1	$(\frac{5}{2}^+); \frac{3}{2}$	0.24 ± 0.03	p	2

This reaction is not observed at $E(^3\text{He}) = 235$ MeV, $\theta_{\text{lab}} = 20^\circ$: the differential cross section (c.m.) is $\leq 4 \times 10^{-11}$ b (1984BI08).

$$2. \ ^{20}\text{Ne}(^3\text{He}, \ ^8\text{Li})^{15}\text{F} \quad Q_{\text{m}} = -29.83$$

This reaction has been studied at $E(^3\text{He}) = 74.5$ MeV (1978BE26) and 75.4 and 87.8 MeV (1978KE06). Two groups are observed: the ground state [$\Gamma_{\text{c.m.}} = 0.8 \pm 0.3$ MeV (1978KE06), 1.2 ± 0.3 MeV (1978BE26)] and a relatively strongly populated state, presumed to be the mirror of $^{15}\text{C}^*(0.74)$ [$J^\pi = \frac{5}{2}^+$], with $E_x = 1.3 \pm 0.1$ MeV (1978KE06), 1.2 ± 0.2 MeV (1978BE26) and $\Gamma_{\text{c.m.}} = 0.5 \pm 0.2$ MeV (1978KE06), 0.24 ± 0.03 MeV (1978BE26). The differential cross section for populating $^{15}\text{F}^*(1.3)$ is 250 ± 20 nb/sr at 10° and $E(^3\text{He}) = 74.5$ MeV (1978BE26) and 80 ± 25 nb/sr at 9° , 87.8 MeV (1978KE06). At $E(^3\text{He}) = 75.4$ MeV, $\theta = 9^\circ$, the ground state is populated with a differential cross section of 8 ± 4 nb/sr (1978KE06).
