Standard Warranty
for
EG&G ORTEC Nuclear Electronic Instruments

EG&G ORTEC warrants that the items will be delivered free from defects in material or workmanship. EG&G ORTEC makes no other warranties, express or implied, and specifically no warranty of merchantability or fitness for a particular purpose.

EG&G ORTEC’s exclusive liability is limited to repairing or replacing at EG&G ORTEC’s option, items found by EG&G ORTEC to be defective in workmanship or materials within two years from the date of delivery. EG&G ORTEC’s liability on any claim of any kind, including negligence, loss or damages arising out of, connected with, or from the performance or breach thereof, or from the manufacture, sale, delivery, resale, repair, or use of any item or services covered by this agreement or purchase order, shall in no case exceed the price allocable to the item or service furnished or any part thereof that gives rise to the claim. In the event EG&G ORTEC fails to manufacture or deliver items called for in this agreement or purchase order, EG&G ORTEC’s exclusive liability and buyer’s exclusive remedy shall be release of the buyer from the obligation to pay the purchase price. In no event shall EG&G ORTEC be liable for special or consequential damages.

Quality Control
Before being approved for shipment, each EG&G ORTEC nuclear electronic instrument must pass a stringent set of quality control tests designed to expose any flaws in materials or workmanship. Permanent records of these tests are maintained for use in warranty repair and as a source of statistical information for design improvements.

Repair Service
If it becomes necessary to return this instrument for repair, it is essential that Customer Service be contacted in advance of its return so that a Return Authorization Number can be assigned to the unit. Also, EG&G ORTEC must be informed, either in writing, by telephone (615) 482-4411 or by telex (65-7450) of the nature of the fault of the instrument being returned and of the model, serial, and revision ("Rev") on rear panel numbers. Failure to do so may cause unnecessary delays in getting the unit repaired. The EG&G ORTEC standard procedure requires that instruments returned for repair pass the same quality control tests that are used for new-production instruments. Instruments that are returned should be packed so that they will withstand normal transit handling and must be shipped PREPAID via Air Parcel Post or United Parcel Service to the nearest EG&G ORTEC repair center. (In the case where the instrument did not function upon purchase, EG&G ORTEC will pay shipping costs both ways.) The address label and the package should include the Return Authorization Number assigned. Instruments being returned that are damaged in transit due to inadequate packing will be repaired at the sender’s expense, and it will be the sender’s responsibility to make claim with the shipper. Instruments not in warranty will be repaired at the standard charge unless they have been grossly misused or mishandled, in which case the user will be notified prior to the repair being done. A quotation will be sent with the notification.

Damage in Transit
Shipments should be examined immediately upon receipt for evidence of external or concealed damage. The carrier making delivery should be notified immediately of any such damage, since the carrier is normally liable for damage in shipment. Packing materials, waybills, and other such documentation should be preserved in order to establish claims. After such notification to the carrier, please notify EG&G ORTEC of the circumstances so that assistance can be provided in making damage claims and in providing replacement equipment if necessary.

ILLUSTRATION

Fig. 4.1. Simplified Block Diagram of One Section of the 574 Timing Amplifier .................. 2
ORTEC 574 TIMING AMPLIFIER MANUAL

1. CHARACTERISTICS

Each of the four independent sections of the 574 Timing Amplifier provides a noninverted signal that is equal to the input signal amplified by a factor of about 4.5. Either unipolar or bipolar signals can be accommodated and are linear within the output range of +1 V to -1 V. The unit is packaged as a single-width NIM module (per TID-20893) for installation in a NIM-standard Bin and Power Supply.

Each of the four sections has a nominal gain of 4.5 in a 50Ω system. The sections can be connected in cascade to provide a total gain of about 20, 90, or 400 within the linear output range. Excellent output stability and very low noise permit cascading two, three, or all four sections as required for each specific application.

The 574 features high bandwidth with 1.2 ns rise time and fall time. It is designed to amplify high speed signals such as the output of fast photomultiplier tubes. Its dc coupling and rapid recovery from overload makes it especially suited for processing long pulses, amplifying them faithfully without significant overshoot, baseline shift, or droop.

The amplifier may be used to precede discriminators, linear gates, or fast current integrators. Its low noise makes it particularly suited to single photon counting applications.

2. SPECIFICATIONS

2.1. PERFORMANCE

BANDWIDTH  dc to 300 MHz; noninverting.

NOMINAL GAIN  4.5 per section.

NOISE  <50 μV rms referred to the input.

NONLINEARITY  <±1% for output to ±1 V.

INSTABILITY  <±100 μV/°C referred to the output.

OVERLOAD RECOVERY  <4 ns for a X20 overload.

PROPAGATION DELAY  2 ns per section typical.

OPERATING TEMPERATURE RANGE  0 to 50°C.

CROSSTALK  <1% between adjacent channels.

2.2. INPUTS

IN  Single BNC connector per section, dc-coupled, bipolar.

Impedance  50Ω.

Linear Range  ±220 mV.

Reflection  <5% from ±10-V transient with 1-ns rise time.

Protection  ±10 V dc; ±50 V transient.

Offset  <±50 μV.

2.3. OUTPUTS

OUT  Single BNC connector per section, dc-coupled; bipolar.

Linear Range  ±1 V on 50Ω.

Rise and Fall Times  Typically 1.2 ns.

Overshoot  <3% for 1-ns rise time input signal.

Offset  Adjustable to ±100 μV on 50Ω.

PREAMP POWER  Rear panel switch ORTEC power connector, Amphenol 17-10090, mates with captive and non-captive power cords on all ORTEC preamplifiers.

2.4. CONTROLS

DC ADJ  One 22-turn front panel potentiometer per section; adjusts the output offset within the range of ±100 μV on 50Ω.

2.5. ELECTRICAL AND MECHANICAL

DIMENSIONS  Single-width module per TID-20893.

POWER REQUIRED  +12 V, 165 mA; -12 V, 165 mA; +24 V, 85 mA; -24 V, 88 mA.
3. APPLICATIONS

3.1. GENERAL

Any section of the 574 can be used to increase the amplitude and retain the polarity of an input signal by a factor of about 4.5. It accepts and processes either unipolar or bipolar input signals.

A typical application is for the very small amplitude signal that is available from the output of a photomultiplier tube in a single photon detecting system. When it is amplified without distortion, the signal is compatible with the input range of many more processing instruments than would otherwise be possible.

The high bandwidth and low noise operation of the 574 permit it to be used for this general function without introducing any significant distortion due to noise, response time, or other interferences.

3.2. CASCADING

When an amplification greater than the factor provided by a single section is desired, the input signal can be cascaded through additional sections of the 574. Each section provides the nominal gain of 4.5 so, for example, cascading the signal through three sections will provide an amplification factor of about 90.

When all four sections of the 574 are connected in cascade, the total amplification factor is about 400. The only restriction is that the limits for linearity at the output are +1 V and −1 V.

4. CIRCUIT DESCRIPTION

Component designations in this circuit description refer to schematic diagram 574-0201-S1, which is in the back of the manual. Since the four sections of the instrument are identical, only one will be discussed. All components in the circuit for the section that is located at the top of the printed circuit use 100-series reference designations, and the duplicate components in the other sections use equivalent designations in the 200-, 300-, and 400-series.

Figure 4.1 is a simplified block diagram of one section of the 574. It operates as a split-phase operational amplifier in which the lower frequency components of the input signal are amplified through dc-coupled IC101 and the higher frequency components are amplified through ac-coupled Q101. The amplified low- and high-frequency components are summed and furnished through Q102 and Q103 to the output.

![Simplified Block Diagram of One Section of the 574 Timing Amplifier.](image)
The function of R105 is to adjust the input dc level to zero. This component is located on the printed circuit near the rear of the circuit for the related section of the instrument. R102 provides the 50Ω termination that is required for the input signal. Diodes D101, 102, and 103 provide overload protection for the input.

The low-frequency gain is fixed by feedback resistor R115 and input resistor R113. The high-frequency gain is fixed by resistors R120 and R109. The function of C106 is to adjust the high-frequency response characteristics. Transistors Q102 and Q103 operate in parallel to reinvert the signal that is summed from Q101 and IC101. This provides an output polarity that is the same as either input polarity at any time.

Inductors L103, 104, and 105 aid in maintaining the high-frequency shaping of the fast signals that are processed in the amplifier. Inductors L101, 102, 106, and 107 isolate the active circuits from the power supply dc levels to prevent feedback through the power supply.

IC1 accepts control from all four dc input power levels and generates +20 V and −20 V for distribution to the amplifier circuits. The +12 V and −12 V dc input power levels from the bin and power supply are carefully filtered and are also distributed to the amplifier circuits.

5. MAINTENANCE AND CALIBRATION

5.1. PREVENTIVE MAINTENANCE
Give reasonable attention to mechanical details. Keep the signal connectors clean at all times. Periodically remove the two cover plates and inspect the interior of the module for dust accumulation or other undesirable conditions. Clean as often as necessary according to local conditions (normally about once every 12 months should be adequate).

5.2. CORRECTIVE MAINTENANCE
Corrective maintenance generally consists of replacing defective components such as resistors, capacitors, diodes, transistors, and integrated circuits, or replacing missing hardware, and of tightening loose hardware. Do not use excessive force when tightening screws or nuts.

When replacing components on a printed circuit board, be sure that the board is not damaged by excessive heating. When unsoldering leads, grip the lead that is to be removed with pliers or some similar tool that acts as a heat sink. Heat the solder joint as little as possible while maintaining a steady pull on the lead to assure its prompt removal. Remove excess solder from the board with a solder-puller. Do not redrill holes in the printed circuit board since many are plated through the board. When the integrity of a plated-through hole is in doubt, solder the component lead on both sides of the board.

When a defective component is to be removed from a printed circuit board, the preferred method is to cut both or all leads to the component and to then remove each of the leads from the board.

5.3. CALIBRATION
So that the input can respond to signal variations of either polarity, it is balanced at zero volts in a bleeder network, connected from +20 V to −20 V as shown in schematic 574-0201-S1. Use the following procedure to calibrate each of the four inputs independently:

1. Furnish power to the module for at least five minutes.
2. Use 50Ω cable to connect the In connector of section 1 to a digital voltmeter.
3. Adjust R105 as necessary to set the input dc level at 0 V ±1 mV. R105 is the single-turn 50Ω1 potentiometer that is mounted on the printed circuit near the rear of the circuit for section 1; the reference designation is etched on the back side of the board.
4. Repeat the measurement and adjustment for the input circuit in each of the other three sections of the module.

When no signal is furnished to the In connector, the dc level for its corresponding Out connector should also be at 0 V.

Use the following procedure to calibrate each of the four outputs after the inputs have been calibrated to 0 V:

1. Use 50Ω cable to connect the Out connector of section 1 to a digital voltmeter.
2. Adjust the front panel DC Adj control, R125, to set the dc level at 0 V ±1 mV. R125 is a 10K 22-turn screwdriver potentiometer.
3. Repeat the measurement and adjustment for the output circuit in each of the other three sections of the module.

Connect an HP215A Pulser or equivalent to the In connector of section 1 on the 574, and use 50Ω cable to furnish the Out signal from section 1 into a Tektronix.
7904 oscilloscope, or equal. Adjust the HP215A to provide a $-22$ mV signal with a width of 20 ns into the amplifier. The output amplitude should be about 100 mV. Adjust C106 on the printed circuit board until both the positive and negative overshoot on the leading and trailing edges of the output signal is less than 3%. The rise time and fall time of the output pulse includes the rise times of the pulse generator and oscilloscope together with the response characteristic of the 574, and the total should be no more than 1.7 ns measured between the 10% and 90% amplitude levels on the output signal. Repeat this calibration of the trimmer capacitor for each of the other three sections in the 574.

5.4. FACTORY REPAIR

This instrument can be returned to the ORTEC factory for service and repair at a nominal cost. Our standard procedure for repair ensures the same quality control and checkout that are used for a new instrument. Always contact the Customer Service Department at ORTEC, (615) 482-4411, before sending in an instrument for repair to obtain shipping instructions and so that the required Return Authorization Number can be assigned to the unit. Write this number on the address label and on the package to ensure prompt attention when it reaches the ORTEC factory.
